Scrapy Documentation

Release 2.13.2

Scrapy developers

Jun 09, 2025

FIRST STEPS

Scrapy is a fast high-level web crawling and web scraping framework, used to crawl websites and extract structured data from their pages. It can be used for a wide range of purposes, from data mining to monitoring and automated testing.

CHAPTER

ONE

GETTING HELP

Having trouble? We'd like to help!

- Try the *FAQ* – it's got answers to some common questions.
- Looking for specific information? Try the genindex or modindex.
- Ask or search questions in StackOverflow using the scrapy tag.
- Ask or search questions in the Scrapy subreddit.
- Search for questions on the archives of the scrapy-users mailing list.
- Ask a question in the #scrapy IRC channel,
- Report bugs with Scrapy in our issue tracker.
- Join the Discord community Scrapy Discord.

CHAPTER

TWO

FIRST STEPS

2.1 Scrapy at a glance

Scrapy (/skrepa/) is an application framework for crawling web sites and extracting structured data which can be used for a wide range of useful applications, like data mining, information processing or historical archival.

Even though Scrapy was originally designed for web scraping, it can also be used to extract data using APIs (such as Amazon Associates Web Services) or as a general purpose web crawler.

2.1.1 Walk-through of an example spider

In order to show you what Scrapy brings to the table, we'll walk you through an example of a Scrapy Spider using the simplest way to run a spider.

Here's the code for a spider that scrapes famous quotes from website https://quotes.toscrape.com, following the pagination:

```
import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"
    start_urls = [
        "https://quotes.toscrape.com/tag/humor/",
    ]

    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {
                "author": quote.xpath("span/small/text()").get(),
                "text": quote.css("span.text::text").get(),
            }

        next_page = response.css('li.next a::attr("href")').get()
        if next_page is not None:
            yield response.follow(next_page, self.parse)
```

Put this in a text file, name it something like `quotes_spider.py` and run the spider using the *runspider* command:

```
scrapy runspider quotes_spider.py -o quotes.jsonl
```

When this finishes you will have in the `quotes.jsonl` file a list of the quotes in JSON Lines format, containing the text and author, which will look like this:

```
{"author": "Jane Austen", "text": "\u201cThe person, be it gentleman or lady, who has␣
↪not pleasure in a good novel, must be intolerably stupid.\u201d"}
{"author": "Steve Martin", "text": "\u201cA day without sunshine is like, you know,␣
↪night.\u201d"}
{"author": "Garrison Keillor", "text": "\u201cAnyone who thinks sitting in church can␣
↪make you a Christian must also think that sitting in a garage can make you a car.\u201d
↪"}
...
```

What just happened?

When you ran the command `scrapy runspider quotes_spider.py`, Scrapy looked for a Spider definition inside it and ran it through its crawler engine.

The crawl started by making requests to the URLs defined in the `start_urls` attribute (in this case, only the URL for quotes in the *humor* category) and called the default callback method `parse`, passing the response object as an argument. In the `parse` callback, we loop through the quote elements using a CSS Selector, yield a Python dict with the extracted quote text and author, look for a link to the next page and schedule another request using the same `parse` method as callback.

Here you will notice one of the main advantages of Scrapy: requests are *scheduled and processed asynchronously*. This means that Scrapy doesn't need to wait for a request to be finished and processed, it can send another request or do other things in the meantime. This also means that other requests can keep going even if a request fails or an error happens while handling it.

While this enables you to do very fast crawls (sending multiple concurrent requests at the same time, in a fault-tolerant way) Scrapy also gives you control over the politeness of the crawl through *a few settings*. You can do things like setting a download delay between each request, limiting the amount of concurrent requests per domain or per IP, and even *using an auto-throttling extension* that tries to figure these settings out automatically.

> **Note**
>
> This is using *feed exports* to generate the JSON file, you can easily change the export format (XML or CSV, for example) or the storage backend (FTP or Amazon S3, for example). You can also write an *item pipeline* to store the items in a database.

2.1.2 What else?

You've seen how to extract and store items from a website using Scrapy, but this is just the surface. Scrapy provides a lot of powerful features for making scraping easy and efficient, such as:

- Built-in support for *selecting and extracting* data from HTML/XML sources using extended CSS selectors and XPath expressions, with helper methods for extraction using regular expressions.
- An *interactive shell console* (IPython aware) for trying out the CSS and XPath expressions to scrape data, which is very useful when writing or debugging your spiders.
- Built-in support for *generating feed exports* in multiple formats (JSON, CSV, XML) and storing them in multiple backends (FTP, S3, local filesystem)
- Robust encoding support and auto-detection, for dealing with foreign, non-standard and broken encoding declarations.
- *Strong extensibility support*, allowing you to plug in your own functionality using *signals* and a well-defined API (middlewares, *extensions*, and *pipelines*).
- A wide range of built-in extensions and middlewares for handling:

  - cookies and session handling
  - HTTP features like compression, authentication, caching
  - user-agent spoofing
  - robots.txt
  - crawl depth restriction
  - and more
- A *Telnet console* for hooking into a Python console running inside your Scrapy process, to introspect and debug your crawler
- Plus other goodies like reusable spiders to crawl sites from Sitemaps and XML/CSV feeds, a media pipeline for *automatically downloading images* (or any other media) associated with the scraped items, a caching DNS resolver, and much more!

2.1.3 What's next?

The next steps for you are to *install Scrapy*, *follow through the tutorial* to learn how to create a full-blown Scrapy project and join the community. Thanks for your interest!

2.2 Installation guide

2.2.1 Supported Python versions

Scrapy requires Python 3.9+, either the CPython implementation (default) or the PyPy implementation (see Alternate Implementations).

2.2.2 Installing Scrapy

If you're using Anaconda or Miniconda, you can install the package from the conda-forge channel, which has up-to-date packages for Linux, Windows and macOS.

To install Scrapy using `conda`, run:

```
conda install -c conda-forge scrapy
```

Alternatively, if you're already familiar with installation of Python packages, you can install Scrapy and its dependencies from PyPI with:

```
pip install Scrapy
```

We strongly recommend that you install Scrapy in *a dedicated virtualenv*, to avoid conflicting with your system packages.

Note that sometimes this may require solving compilation issues for some Scrapy dependencies depending on your operating system, so be sure to check the *Platform specific installation notes*.

For more detailed and platform-specific instructions, as well as troubleshooting information, read on.

Things that are good to know

Scrapy is written in pure Python and depends on a few key Python packages (among others):

- lxml, an efficient XML and HTML parser
- parsel, an HTML/XML data extraction library written on top of lxml,

- w3lib, a multi-purpose helper for dealing with URLs and web page encodings
- twisted, an asynchronous networking framework
- cryptography and pyOpenSSL, to deal with various network-level security needs

Some of these packages themselves depend on non-Python packages that might require additional installation steps depending on your platform. Please check *platform-specific guides below*.

In case of any trouble related to these dependencies, please refer to their respective installation instructions:

- lxml installation
- cryptography installation

Using a virtual environment (recommended)

TL;DR: We recommend installing Scrapy inside a virtual environment on all platforms.

Python packages can be installed either globally (a.k.a system wide), or in user-space. We do not recommend installing Scrapy system wide.

Instead, we recommend that you install Scrapy within a so-called "virtual environment" (`venv`). Virtual environments allow you to not conflict with already-installed Python system packages (which could break some of your system tools and scripts), and still install packages normally with `pip` (without `sudo` and the likes).

See Virtual Environments and Packages on how to create your virtual environment.

Once you have created a virtual environment, you can install Scrapy inside it with `pip`, just like any other Python package. (See *platform-specific guides* below for non-Python dependencies that you may need to install beforehand).

2.2.3 Platform specific installation notes

Windows

Though it's possible to install Scrapy on Windows using pip, we recommend you install Anaconda or Miniconda and use the package from the conda-forge channel, which will avoid most installation issues.

Once you've installed Anaconda or Miniconda, install Scrapy with:

```
conda install -c conda-forge scrapy
```

To install Scrapy on Windows using `pip`:

> **Warning**
>
> This installation method requires "Microsoft Visual C++" for installing some Scrapy dependencies, which demands significantly more disk space than Anaconda.

1. Download and execute Microsoft C++ Build Tools to install the Visual Studio Installer.
2. Run the Visual Studio Installer.
3. Under the Workloads section, select **C++ build tools**.
4. Check the installation details and make sure following packages are selected as optional components:
   - **MSVC** (e.g MSVC v142 - VS 2019 C++ x64/x86 build tools (v14.23))
   - **Windows SDK** (e.g Windows 10 SDK (10.0.18362.0))
5. Install the Visual Studio Build Tools.

Now, you should be able to *install Scrapy* using `pip`.

Ubuntu 14.04 or above

Scrapy is currently tested with recent-enough versions of lxml, twisted and pyOpenSSL, and is compatible with recent Ubuntu distributions. But it should support older versions of Ubuntu too, like Ubuntu 14.04, albeit with potential issues with TLS connections.

Don't use the `python-scrapy` package provided by Ubuntu, they are typically too old and slow to catch up with the latest Scrapy release.

To install Scrapy on Ubuntu (or Ubuntu-based) systems, you need to install these dependencies:

```
sudo apt-get install python3 python3-dev python3-pip libxml2-dev libxslt1-dev zlib1g-dev␣
↪libffi-dev libssl-dev
```

- `python3-dev`, `zlib1g-dev`, `libxml2-dev` and `libxslt1-dev` are required for `lxml`
- `libssl-dev` and `libffi-dev` are required for `cryptography`

Inside a *virtualenv*, you can install Scrapy with `pip` after that:

```
pip install scrapy
```

> **Note**
>
> The same non-Python dependencies can be used to install Scrapy in Debian Jessie (8.0) and above.

macOS

Building Scrapy's dependencies requires the presence of a C compiler and development headers. On macOS this is typically provided by Apple's Xcode development tools. To install the Xcode command-line tools, open a terminal window and run:

```
xcode-select --install
```

There's a known issue that prevents `pip` from updating system packages. This has to be addressed to successfully install Scrapy and its dependencies. Here are some proposed solutions:

- *(Recommended)* **Don't** use system Python. Install a new, updated version that doesn't conflict with the rest of your system. Here's how to do it using the homebrew package manager:
  - Install homebrew following the instructions in https://brew.sh/
  - Update your `PATH` variable to state that homebrew packages should be used before system packages (Change `.bashrc` to `.zshrc` accordingly if you're using zsh as default shell):

    ```
    echo "export PATH=/usr/local/bin:/usr/local/sbin:$PATH" >> ~/.bashrc
    ```

  - Reload `.bashrc` to ensure the changes have taken place:

    ```
    source ~/.bashrc
    ```

  - Install python:

    ```
    brew install python
    ```

- *(Optional)* *Install Scrapy inside a Python virtual environment*.

This method is a workaround for the above macOS issue, but it's an overall good practice for managing dependencies and can complement the first method.

After any of these workarounds you should be able to install Scrapy:

```
pip install Scrapy
```

PyPy

We recommend using the latest PyPy version. For PyPy3, only Linux installation was tested.

Most Scrapy dependencies now have binary wheels for CPython, but not for PyPy. This means that these dependencies will be built during installation. On macOS, you are likely to face an issue with building the Cryptography dependency. The solution to this problem is described here, that is to `brew install openssl` and then export the flags that this command recommends (only needed when installing Scrapy). Installing on Linux has no special issues besides installing build dependencies. Installing Scrapy with PyPy on Windows is not tested.

You can check that Scrapy is installed correctly by running `scrapy bench`. If this command gives errors such as `TypeError: ... got 2 unexpected keyword arguments`, this means that setuptools was unable to pick up one PyPy-specific dependency. To fix this issue, run `pip install 'PyPyDispatcher>=2.1.0'`.

2.2.4 Troubleshooting

AttributeError: 'module' object has no attribute 'OP_NO_TLSv1_1'

After you install or upgrade Scrapy, Twisted or pyOpenSSL, you may get an exception with the following traceback:

```
[...]
  File "[...]/site-packages/twisted/protocols/tls.py", line 63, in <module>
    from twisted.internet._sslverify import _setAcceptableProtocols
  File "[...]/site-packages/twisted/internet/_sslverify.py", line 38, in <module>
    TLSVersion.TLSv1_1: SSL.OP_NO_TLSv1_1,
AttributeError: 'module' object has no attribute 'OP_NO_TLSv1_1'
```

The reason you get this exception is that your system or virtual environment has a version of pyOpenSSL that your version of Twisted does not support.

To install a version of pyOpenSSL that your version of Twisted supports, reinstall Twisted with the `tls` extra option:

```
pip install twisted[tls]
```

For details, see Issue #2473.

2.3 Scrapy Tutorial

In this tutorial, we'll assume that Scrapy is already installed on your system. If that's not the case, see *Installation guide*.

We are going to scrape quotes.toscrape.com, a website that lists quotes from famous authors.

This tutorial will walk you through these tasks:

1. Creating a new Scrapy project
2. Writing a *spider* to crawl a site and extract data
3. Exporting the scraped data using the command line
4. Changing spider to recursively follow links

5. Using spider arguments

Scrapy is written in Python. The more you learn about Python, the more you can get out of Scrapy.

If you're already familiar with other languages and want to learn Python quickly, the Python Tutorial is a good resource.

If you're new to programming and want to start with Python, the following books may be useful to you:

- Automate the Boring Stuff With Python
- How To Think Like a Computer Scientist
- Learn Python 3 The Hard Way

You can also take a look at this list of Python resources for non-programmers, as well as the suggested resources in the learnpython-subreddit.

2.3.1 Creating a project

Before you start scraping, you will have to set up a new Scrapy project. Enter a directory where you'd like to store your code and run:

```
scrapy startproject tutorial
```

This will create a `tutorial` directory with the following contents:

```
tutorial/
    scrapy.cfg            # deploy configuration file

    tutorial/             # project's Python module, you'll import your code from here
        __init__.py

        items.py          # project items definition file

        middlewares.py    # project middlewares file

        pipelines.py      # project pipelines file

        settings.py       # project settings file

        spiders/          # a directory where you'll later put your spiders
            __init__.py
```

2.3.2 Our first Spider

Spiders are classes that you define and that Scrapy uses to scrape information from a website (or a group of websites). They must subclass *Spider* and define the initial requests to be made, and optionally, how to follow links in pages and parse the downloaded page content to extract data.

This is the code for our first Spider. Save it in a file named `quotes_spider.py` under the `tutorial/spiders` directory in your project:

```
from pathlib import Path

import scrapy

class QuotesSpider(scrapy.Spider):
```

(continues on next page)

(continued from previous page)

```
    name = "quotes"

    async def start(self):
        urls = [
            "https://quotes.toscrape.com/page/1/",
            "https://quotes.toscrape.com/page/2/",
        ]
        for url in urls:
            yield scrapy.Request(url=url, callback=self.parse)

    def parse(self, response):
        page = response.url.split("/")[-2]
        filename = f"quotes-{page}.html"
        Path(filename).write_bytes(response.body)
        self.log(f"Saved file {filename}")
```

As you can see, our Spider subclasses *scrapy.Spider* and defines some attributes and methods:

- *name*: identifies the Spider. It must be unique within a project, that is, you can't set the same name for different Spiders.
- *start()*: must be an asynchronous generator that yields requests (and, optionally, items) for the spider to start crawling. Subsequent requests will be generated successively from these initial requests.
- *parse()*: a method that will be called to handle the response downloaded for each of the requests made. The response parameter is an instance of *TextResponse* that holds the page content and has further helpful methods to handle it.

  The *parse()* method usually parses the response, extracting the scraped data as dicts and also finding new URLs to follow and creating new requests (*Request*) from them.

How to run our spider

To put our spider to work, go to the project's top level directory and run:

```
scrapy crawl quotes
```

This command runs the spider named `quotes` that we've just added, that will send some requests for the `quotes.toscrape.com` domain. You will get an output similar to this:

```
... (omitted for brevity)
2016-12-16 21:24:05 [scrapy.core.engine] INFO: Spider opened
2016-12-16 21:24:05 [scrapy.extensions.logstats] INFO: Crawled 0 pages (at 0 pages/min),␣
↪scraped 0 items (at 0 items/min)
2016-12-16 21:24:05 [scrapy.extensions.telnet] DEBUG: Telnet console listening on 127.0.
↪0.1:6023
2016-12-16 21:24:05 [scrapy.core.engine] DEBUG: Crawled (404) <GET https://quotes.
↪toscrape.com/robots.txt> (referer: None)
2016-12-16 21:24:05 [scrapy.core.engine] DEBUG: Crawled (200) <GET https://quotes.
↪toscrape.com/page/1/> (referer: None)
2016-12-16 21:24:05 [scrapy.core.engine] DEBUG: Crawled (200) <GET https://quotes.
↪toscrape.com/page/2/> (referer: None)
2016-12-16 21:24:05 [quotes] DEBUG: Saved file quotes-1.html
2016-12-16 21:24:05 [quotes] DEBUG: Saved file quotes-2.html
```

(continues on next page)

(continued from previous page)

```
2016-12-16 21:24:05 [scrapy.core.engine] INFO: Closing spider (finished)
...
```

Now, check the files in the current directory. You should notice that two new files have been created: *quotes-1.html* and *quotes-2.html*, with the content for the respective URLs, as our `parse` method instructs.

Note

If you are wondering why we haven't parsed the HTML yet, hold on, we will cover that soon.

What just happened under the hood?

Scrapy sends the first *scrapy.Request* objects yielded by the *start()* spider method. Upon receiving a response for each one, Scrapy calls the callback method associated with the request (in this case, the `parse` method) with a *Response* object.

A shortcut to the `start` method

Instead of implementing a *start()* method that yields *Request* objects from URLs, you can define a *start_urls* class attribute with a list of URLs. This list will then be used by the default implementation of *start()* to create the initial requests for your spider.

```
from pathlib import Path

import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"
    start_urls = [
        "https://quotes.toscrape.com/page/1/",
        "https://quotes.toscrape.com/page/2/",
    ]

    def parse(self, response):
        page = response.url.split("/")[-2]
        filename = f"quotes-{page}.html"
        Path(filename).write_bytes(response.body)
```

The *parse()* method will be called to handle each of the requests for those URLs, even though we haven't explicitly told Scrapy to do so. This happens because *parse()* is Scrapy's default callback method, which is called for requests without an explicitly assigned callback.

Extracting data

The best way to learn how to extract data with Scrapy is trying selectors using the *Scrapy shell*. Run:

```
scrapy shell 'https://quotes.toscrape.com/page/1/'
```

Note

Remember to always enclose URLs in quotes when running Scrapy shell from the command line, otherwise URLs containing arguments (i.e. & character) will not work.

On Windows, use double quotes instead:

```
scrapy shell "https://quotes.toscrape.com/page/1/"
```

You will see something like:

```
[ ... Scrapy log here ... ]
2016-09-19 12:09:27 [scrapy.core.engine] DEBUG: Crawled (200) <GET https://quotes.
↪toscrape.com/page/1/> (referer: None)
[s] Available Scrapy objects:
[s]   scrapy     scrapy module (contains scrapy.Request, scrapy.Selector, etc)
[s]   crawler    <scrapy.crawler.Crawler object at 0x7fa91d888c90>
[s]   item       {}
[s]   request    <GET https://quotes.toscrape.com/page/1/>
[s]   response   <200 https://quotes.toscrape.com/page/1/>
[s]   settings   <scrapy.settings.Settings object at 0x7fa91d888c10>
[s]   spider     <DefaultSpider 'default' at 0x7fa91c8af990>
[s] Useful shortcuts:
[s]   shelp()           Shell help (print this help)
[s]   fetch(req_or_url) Fetch request (or URL) and update local objects
[s]   view(response)    View response in a browser
```

Using the shell, you can try selecting elements using CSS with the response object:

```
>>> response.css("title")
[<Selector query='descendant-or-self::title' data='<title>Quotes to Scrape</title>'>]
```

The result of running `response.css('title')` is a list-like object called *SelectorList*, which represents a list of *Selector* objects that wrap around XML/HTML elements and allow you to run further queries to refine the selection or extract the data.

To extract the text from the title above, you can do:

```
>>> response.css("title::text").getall()
['Quotes to Scrape']
```

There are two things to note here: one is that we've added `::text` to the CSS query, to mean we want to select only the text elements directly inside `<title>` element. If we don't specify `::text`, we'd get the full title element, including its tags:

```
>>> response.css("title").getall()
['<title>Quotes to Scrape</title>']
```

The other thing is that the result of calling `.getall()` is a list: it is possible that a selector returns more than one result, so we extract them all. When you know you just want the first result, as in this case, you can do:

```
>>> response.css("title::text").get()
'Quotes to Scrape'
```

As an alternative, you could've written:

```
>>> response.css("title::text")[0].get()
'Quotes to Scrape'
```

Accessing an index on a *SelectorList* instance will raise an IndexError exception if there are no results:

```
>>> response.css("noelement")[0].get()
Traceback (most recent call last):
...
IndexError: list index out of range
```

You might want to use `.get()` directly on the *SelectorList* instance instead, which returns `None` if there are no results:

```
>>> response.css("noelement").get()
```

There's a lesson here: for most scraping code, you want it to be resilient to errors due to things not being found on a page, so that even if some parts fail to be scraped, you can at least get **some** data.

Besides the *getall()* and *get()* methods, you can also use the *re()* method to extract using regular expressions:

```
>>> response.css("title::text").re(r"Quotes.*")
['Quotes to Scrape']
>>> response.css("title::text").re(r"Q\w+")
['Quotes']
>>> response.css("title::text").re(r"(\w+) to (\w+)")
['Quotes', 'Scrape']
```

In order to find the proper CSS selectors to use, you might find it useful to open the response page from the shell in your web browser using `view(response)`. You can use your browser's developer tools to inspect the HTML and come up with a selector (see *Using your browser's Developer Tools for scraping*).

Selector Gadget is also a nice tool to quickly find CSS selector for visually selected elements, which works in many browsers.

XPath: a brief intro

Besides CSS, Scrapy selectors also support using XPath expressions:

```
>>> response.xpath("//title")
[<Selector query='//title' data='<title>Quotes to Scrape</title>'>]
>>> response.xpath("//title/text()").get()
'Quotes to Scrape'
```

XPath expressions are very powerful, and are the foundation of Scrapy Selectors. In fact, CSS selectors are converted to XPath under-the-hood. You can see that if you read the text representation of the selector objects in the shell closely.

While perhaps not as popular as CSS selectors, XPath expressions offer more power because besides navigating the structure, it can also look at the content. Using XPath, you're able to select things like: *the link that contains the text "Next Page"*. This makes XPath very fitting to the task of scraping, and we encourage you to learn XPath even if you already know how to construct CSS selectors, it will make scraping much easier.

We won't cover much of XPath here, but you can read more about *using XPath with Scrapy Selectors here*. To learn more about XPath, we recommend this tutorial to learn XPath through examples, and this tutorial to learn "how to think in XPath".

Extracting quotes and authors

Now that you know a bit about selection and extraction, let's complete our spider by writing the code to extract the quotes from the web page.

Each quote in https://quotes.toscrape.com is represented by HTML elements that look like this:

```
<div class="quote">
    <span class="text">“The world as we have created it is a process of our
    thinking. It cannot be changed without changing our thinking.”</span>
    <span>
        by <small class="author">Albert Einstein</small>
        <a href="/author/Albert-Einstein">(about)</a>
    </span>
    <div class="tags">
        Tags:
        <a class="tag" href="/tag/change/page/1/">change</a>
        <a class="tag" href="/tag/deep-thoughts/page/1/">deep-thoughts</a>
        <a class="tag" href="/tag/thinking/page/1/">thinking</a>
        <a class="tag" href="/tag/world/page/1/">world</a>
    </div>
</div>
```

Let's open up scrapy shell and play a bit to find out how to extract the data we want:

```
scrapy shell 'https://quotes.toscrape.com'
```

We get a list of selectors for the quote HTML elements with:

```
>>> response.css("div.quote")
[<Selector query="descendant-or-self::div[@class and contains(concat(' ', normalize-
↪space(@class), ' '), ' quote ')]" data='<div class="quote" itemscope itemtype...'>,
<Selector query="descendant-or-self::div[@class and contains(concat(' ', normalize-
↪space(@class), ' '), ' quote ')]" data='<div class="quote" itemscope itemtype...'>,
...]
```

Each of the selectors returned by the query above allows us to run further queries over their sub-elements. Let's assign the first selector to a variable, so that we can run our CSS selectors directly on a particular quote:

```
>>> quote = response.css("div.quote")[0]
```

Now, let's extract the `text`, `author` and `tags` from that quote using the `quote` object we just created:

```
>>> text = quote.css("span.text::text").get()
>>> text
'“The world as we have created it is a process of our thinking. It cannot be changed␣
↪without changing our thinking.”'
>>> author = quote.css("small.author::text").get()
>>> author
'Albert Einstein'
```

Given that the tags are a list of strings, we can use the `.getall()` method to get all of them:

```
>>> tags = quote.css("div.tags a.tag::text").getall()
>>> tags
['change', 'deep-thoughts', 'thinking', 'world']
```

Having figured out how to extract each bit, we can now iterate over all the quote elements and put them together into a Python dictionary:

```
>>> for quote in response.css("div.quote"):
...     text = quote.css("span.text::text").get()
...     author = quote.css("small.author::text").get()
...     tags = quote.css("div.tags a.tag::text").getall()
...     print(dict(text=text, author=author, tags=tags))
...
{'text': '“The world as we have created it is a process of our thinking. It cannot be␣
↪changed without changing our thinking.”', 'author': 'Albert Einstein', 'tags': ['change
↪', 'deep-thoughts', 'thinking', 'world']}
{'text': '“It is our choices, Harry, that show what we truly are, far more than our␣
↪abilities.”', 'author': 'J.K. Rowling', 'tags': ['abilities', 'choices']}
...
```

Extracting data in our spider

Let's get back to our spider. Until now, it hasn't extracted any data in particular, just saving the whole HTML page to a local file. Let's integrate the extraction logic above into our spider.

A Scrapy spider typically generates many dictionaries containing the data extracted from the page. To do that, we use the `yield` Python keyword in the callback, as you can see below:

```
import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"
    start_urls = [
        "https://quotes.toscrape.com/page/1/",
        "https://quotes.toscrape.com/page/2/",
    ]

    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {
                "text": quote.css("span.text::text").get(),
                "author": quote.css("small.author::text").get(),
                "tags": quote.css("div.tags a.tag::text").getall(),
            }
```

To run this spider, exit the scrapy shell by entering:

```
quit()
```

Then, run:

```
scrapy crawl quotes
```

Now, it should output the extracted data with the log:

```
2016-09-19 18:57:19 [scrapy.core.scraper] DEBUG: Scraped from <200 https://quotes.
↪toscrape.com/page/1/>
{'tags': ['life', 'love'], 'author': 'André Gide', 'text': '“It is better to be hated␣
```

(continues on next page)

(continued from previous page)

```
↪for what you are than to be loved for what you are not."'}
2016-09-19 18:57:19 [scrapy.core.scraper] DEBUG: Scraped from <200 https://quotes.
↪toscrape.com/page/1/>
{'tags': ['edison', 'failure', 'inspirational', 'paraphrased'], 'author': 'Thomas A.␣
↪Edison', 'text': '"I have not failed. I've just found 10,000 ways that won't work."'}
```

2.3.3 Storing the scraped data

The simplest way to store the scraped data is by using *Feed exports*, with the following command:

```
scrapy crawl quotes -O quotes.json
```

That will generate a `quotes.json` file containing all scraped items, serialized in JSON.

The `-O` command-line switch overwrites any existing file; use `-o` instead to append new content to any existing file. However, appending to a JSON file makes the file contents invalid JSON. When appending to a file, consider using a different serialization format, such as JSON Lines:

```
scrapy crawl quotes -o quotes.jsonl
```

The JSON Lines format is useful because it's stream-like, so you can easily append new records to it. It doesn't have the same problem as JSON when you run twice. Also, as each record is a separate line, you can process big files without having to fit everything in memory, there are tools like JQ to help do that at the command-line.

In small projects (like the one in this tutorial), that should be enough. However, if you want to perform more complex things with the scraped items, you can write an *Item Pipeline*. A placeholder file for Item Pipelines has been set up for you when the project is created, in `tutorial/pipelines.py`. Though you don't need to implement any item pipelines if you just want to store the scraped items.

2.3.4 Following links

Let's say, instead of just scraping the stuff from the first two pages from https://quotes.toscrape.com, you want quotes from all the pages in the website.

Now that you know how to extract data from pages, let's see how to follow links from them.

The first thing to do is extract the link to the page we want to follow. Examining our page, we can see there is a link to the next page with the following markup:

```
<ul class="pager">
    <li class="next">
        <a href="/page/2/">Next <span aria-hidden="true">&rarr;</span></a>
    </li>
</ul>
```

We can try extracting it in the shell:

```
>>> response.css('li.next a').get()
'<a href="/page/2/">Next <span aria-hidden="true">→</span></a>'
```

This gets the anchor element, but we want the attribute `href`. For that, Scrapy supports a CSS extension that lets you select the attribute contents, like this:

```
>>> response.css("li.next a::attr(href)").get()
'/page/2/'
```

There is also an `attrib` property available (see *Selecting element attributes* for more):

```
>>> response.css("li.next a").attrib["href"]
'/page/2/'
```

Now let's see our spider, modified to recursively follow the link to the next page, extracting data from it:

```
import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"
    start_urls = [
        "https://quotes.toscrape.com/page/1/",
    ]

    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {
                "text": quote.css("span.text::text").get(),
                "author": quote.css("small.author::text").get(),
                "tags": quote.css("div.tags a.tag::text").getall(),
            }

        next_page = response.css("li.next a::attr(href)").get()
        if next_page is not None:
            next_page = response.urljoin(next_page)
            yield scrapy.Request(next_page, callback=self.parse)
```

Now, after extracting the data, the `parse()` method looks for the link to the next page, builds a full absolute URL using the *`urljoin()`* method (since the links can be relative) and yields a new request to the next page, registering itself as callback to handle the data extraction for the next page and to keep the crawling going through all the pages.

What you see here is Scrapy's mechanism of following links: when you yield a Request in a callback method, Scrapy will schedule that request to be sent and register a callback method to be executed when that request finishes.

Using this, you can build complex crawlers that follow links according to rules you define, and extract different kinds of data depending on the page it's visiting.

In our example, it creates a sort of loop, following all the links to the next page until it doesn't find one – handy for crawling blogs, forums and other sites with pagination.

A shortcut for creating Requests

As a shortcut for creating Request objects you can use *`response.follow`*:

```
import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"
    start_urls = [
        "https://quotes.toscrape.com/page/1/",
    ]

    def parse(self, response):
```

(continues on next page)

(continued from previous page)

```
        for quote in response.css("div.quote"):
            yield {
                "text": quote.css("span.text::text").get(),
                "author": quote.css("span small::text").get(),
                "tags": quote.css("div.tags a.tag::text").getall(),
            }

        next_page = response.css("li.next a::attr(href)").get()
        if next_page is not None:
            yield response.follow(next_page, callback=self.parse)
```

Unlike scrapy.Request, `response.follow` supports relative URLs directly - no need to call urljoin. Note that `response.follow` just returns a Request instance; you still have to yield this Request.

You can also pass a selector to `response.follow` instead of a string; this selector should extract necessary attributes:

```
for href in response.css("ul.pager a::attr(href)"):
    yield response.follow(href, callback=self.parse)
```

For <a> elements there is a shortcut: `response.follow` uses their href attribute automatically. So the code can be shortened further:

```
for a in response.css("ul.pager a"):
    yield response.follow(a, callback=self.parse)
```

To create multiple requests from an iterable, you can use *response.follow_all* instead:

```
anchors = response.css("ul.pager a")
yield from response.follow_all(anchors, callback=self.parse)
```

or, shortening it further:

```
yield from response.follow_all(css="ul.pager a", callback=self.parse)
```

More examples and patterns

Here is another spider that illustrates callbacks and following links, this time for scraping author information:

```
import scrapy

class AuthorSpider(scrapy.Spider):
    name = "author"

    start_urls = ["https://quotes.toscrape.com/"]

    def parse(self, response):
        author_page_links = response.css(".author + a")
        yield from response.follow_all(author_page_links, self.parse_author)

        pagination_links = response.css("li.next a")
        yield from response.follow_all(pagination_links, self.parse)
```

(continues on next page)

(continued from previous page)

```
    def parse_author(self, response):
        def extract_with_css(query):
            return response.css(query).get(default="").strip()

        yield {
            "name": extract_with_css("h3.author-title::text"),
            "birthdate": extract_with_css(".author-born-date::text"),
            "bio": extract_with_css(".author-description::text"),
        }
```

This spider will start from the main page, it will follow all the links to the authors pages calling the `parse_author` callback for each of them, and also the pagination links with the `parse` callback as we saw before.

Here we're passing callbacks to *response.follow_all* as positional arguments to make the code shorter; it also works for *Request*.

The `parse_author` callback defines a helper function to extract and cleanup the data from a CSS query and yields the Python dict with the author data.

Another interesting thing this spider demonstrates is that, even if there are many quotes from the same author, we don't need to worry about visiting the same author page multiple times. By default, Scrapy filters out duplicated requests to URLs already visited, avoiding the problem of hitting servers too much because of a programming mistake. This can be configured in the *DUPEFILTER_CLASS* setting.

Hopefully by now you have a good understanding of how to use the mechanism of following links and callbacks with Scrapy.

As yet another example spider that leverages the mechanism of following links, check out the *CrawlSpider* class for a generic spider that implements a small rules engine that you can use to write your crawlers on top of it.

Also, a common pattern is to build an item with data from more than one page, using a *trick to pass additional data to the callbacks*.

2.3.5 Using spider arguments

You can provide command line arguments to your spiders by using the `-a` option when running them:

```
scrapy crawl quotes -O quotes-humor.json -a tag=humor
```

These arguments are passed to the Spider's `__init__` method and become spider attributes by default.

In this example, the value provided for the `tag` argument will be available via `self.tag`. You can use this to make your spider fetch only quotes with a specific tag, building the URL based on the argument:

```
import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"

    async def start(self):
        url = "https://quotes.toscrape.com/"
        tag = getattr(self, "tag", None)
        if tag is not None:
            url = url + "tag/" + tag
        yield scrapy.Request(url, self.parse)
```

(continues on next page)

(continued from previous page)

```
    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {
                "text": quote.css("span.text::text").get(),
                "author": quote.css("small.author::text").get(),
            }

        next_page = response.css("li.next a::attr(href)").get()
        if next_page is not None:
            yield response.follow(next_page, self.parse)
```

If you pass the `tag=humor` argument to this spider, you'll notice that it will only visit URLs from the `humor` tag, such as `https://quotes.toscrape.com/tag/humor`.

You can *learn more about handling spider arguments here*.

2.3.6 Next steps

This tutorial covered only the basics of Scrapy, but there's a lot of other features not mentioned here. Check the *What else?* section in the *Scrapy at a glance* chapter for a quick overview of the most important ones.

You can continue from the section *Basic concepts* to know more about the command-line tool, spiders, selectors and other things the tutorial hasn't covered like modeling the scraped data. If you'd prefer to play with an example project, check the *Examples* section.

2.4 Examples

The best way to learn is with examples, and Scrapy is no exception. For this reason, there is an example Scrapy project named quotesbot, that you can use to play and learn more about Scrapy. It contains two spiders for https://quotes.toscrape.com, one using CSS selectors and another one using XPath expressions.

The quotesbot project is available at: https://github.com/scrapy/quotesbot. You can find more information about it in the project's README.

If you're familiar with git, you can checkout the code. Otherwise you can download the project as a zip file by clicking here.

CHAPTER

THREE

BASIC CONCEPTS

3.1 Command line tool

Scrapy is controlled through the `scrapy` command-line tool, to be referred to here as the "Scrapy tool" to differentiate it from the sub-commands, which we just call "commands" or "Scrapy commands".

The Scrapy tool provides several commands, for multiple purposes, and each one accepts a different set of arguments and options.

(The `scrapy deploy` command has been removed in 1.0 in favor of the standalone `scrapyd-deploy`. See Deploying your project.)

3.1.1 Configuration settings

Scrapy will look for configuration parameters in ini-style `scrapy.cfg` files in standard locations:

1. `/etc/scrapy.cfg` or `c:\scrapy\scrapy.cfg` (system-wide),
2. `~/.config/scrapy.cfg` (`$XDG_CONFIG_HOME`) and `~/.scrapy.cfg` (`$HOME`) for global (user-wide) settings, and
3. `scrapy.cfg` inside a Scrapy project's root (see next section).

Settings from these files are merged in the listed order of preference: user-defined values have higher priority than system-wide defaults and project-wide settings will override all others, when defined.

Scrapy also understands, and can be configured through, a number of environment variables. Currently these are:

- `SCRAPY_SETTINGS_MODULE` (see *Designating the settings*)
- `SCRAPY_PROJECT` (see *Sharing the root directory between projects*)
- `SCRAPY_PYTHON_SHELL` (see *Scrapy shell*)

3.1.2 Default structure of Scrapy projects

Before delving into the command-line tool and its sub-commands, let's first understand the directory structure of a Scrapy project.

Though it can be modified, all Scrapy projects have the same file structure by default, similar to this:

```
scrapy.cfg
myproject/
    __init__.py
    items.py
    middlewares.py
    pipelines.py
```

(continues on next page)

(continued from previous page)

```
    settings.py
    spiders/
        __init__.py
        spider1.py
        spider2.py
        ...
```

The directory where the `scrapy.cfg` file resides is known as the *project root directory*. That file contains the name of the python module that defines the project settings. Here is an example:

```
[settings]
default = myproject.settings
```

3.1.3 Sharing the root directory between projects

A project root directory, the one that contains the `scrapy.cfg`, may be shared by multiple Scrapy projects, each with its own settings module.

In that case, you must define one or more aliases for those settings modules under `[settings]` in your `scrapy.cfg` file:

```
[settings]
default = myproject1.settings
project1 = myproject1.settings
project2 = myproject2.settings
```

By default, the `scrapy` command-line tool will use the `default` settings. Use the `SCRAPY_PROJECT` environment variable to specify a different project for `scrapy` to use:

```
$ scrapy settings --get BOT_NAME
Project 1 Bot
$ export SCRAPY_PROJECT=project2
$ scrapy settings --get BOT_NAME
Project 2 Bot
```

3.1.4 Using the `scrapy` tool

You can start by running the Scrapy tool with no arguments and it will print some usage help and the available commands:

```
Scrapy X.Y - no active project

Usage:
  scrapy <command> [options] [args]

Available commands:
  crawl         Run a spider
  fetch         Fetch a URL using the Scrapy downloader
[...]
```

The first line will print the currently active project if you're inside a Scrapy project. In this example it was run from outside a project. If run from inside a project it would have printed something like this:

```
Scrapy X.Y - project: myproject

Usage:
  scrapy <command> [options] [args]

[...]
```

Creating projects

The first thing you typically do with the `scrapy` tool is create your Scrapy project:

```
scrapy startproject myproject [project_dir]
```

That will create a Scrapy project under the `project_dir` directory. If `project_dir` wasn't specified, `project_dir` will be the same as `myproject`.

Next, you go inside the new project directory:

```
cd project_dir
```

And you're ready to use the `scrapy` command to manage and control your project from there.

Controlling projects

You use the `scrapy` tool from inside your projects to control and manage them.

For example, to create a new spider:

```
scrapy genspider mydomain mydomain.com
```

Some Scrapy commands (like *crawl*) must be run from inside a Scrapy project. See the *commands reference* below for more information on which commands must be run from inside projects, and which not.

Also keep in mind that some commands may have slightly different behaviours when running them from inside projects. For example, the fetch command will use spider-overridden behaviours (such as the `user_agent` attribute to override the user-agent) if the url being fetched is associated with some specific spider. This is intentional, as the `fetch` command is meant to be used to check how spiders are downloading pages.

3.1.5 Available tool commands

This section contains a list of the available built-in commands with a description and some usage examples. Remember, you can always get more info about each command by running:

```
scrapy <command> -h
```

And you can see all available commands with:

```
scrapy -h
```

There are two kinds of commands, those that only work from inside a Scrapy project (Project-specific commands) and those that also work without an active Scrapy project (Global commands), though they may behave slightly differently when run from inside a project (as they would use the project overridden settings).

Global commands:

- *startproject*
- *genspider*

- *settings*
- *runspider*
- *shell*
- *fetch*
- *view*
- *version*

Project-only commands:

- *crawl*
- *check*
- *list*
- *edit*
- *parse*
- *bench*

startproject

- Syntax: `scrapy startproject <project_name> [project_dir]`
- Requires project: *no*

Creates a new Scrapy project named `project_name`, under the `project_dir` directory. If `project_dir` wasn't specified, `project_dir` will be the same as `project_name`.

Usage example:

```
$ scrapy startproject myproject
```

genspider

- Syntax: `scrapy genspider [-t template] <name> <domain or URL>`
- Requires project: *no*

Added in version 2.6.0: The ability to pass a URL instead of a domain.

Creates a new spider in the current folder or in the current project's `spiders` folder, if called from inside a project. The `<name>` parameter is set as the spider's `name`, while `<domain or URL>` is used to generate the `allowed_domains` and `start_urls` spider's attributes.

Usage example:

```
$ scrapy genspider -l
Available templates:
  basic
  crawl
  csvfeed
  xmlfeed

$ scrapy genspider example example.com
Created spider 'example' using template 'basic'
```

(continues on next page)

(continued from previous page)

```
$ scrapy genspider -t crawl scrapyorg scrapy.org
Created spider 'scrapyorg' using template 'crawl'
```

This is just a convenient shortcut command for creating spiders based on pre-defined templates, but certainly not the only way to create spiders. You can just create the spider source code files yourself, instead of using this command.

crawl

- Syntax: `scrapy crawl <spider>`
- Requires project: *yes*

Start crawling using a spider.

Supported options:

- `-h, --help`: show a help message and exit
- `-a NAME=VALUE`: set a spider argument (may be repeated)
- `--output FILE` or `-o FILE`: append scraped items to the end of FILE (use - for stdout). To define the output format, set a colon at the end of the output URI (i.e. `-o FILE:FORMAT`)
- `--overwrite-output FILE` or `-O FILE`: dump scraped items into FILE, overwriting any existing file. To define the output format, set a colon at the end of the output URI (i.e. `-O FILE:FORMAT`)

Usage examples:

```
$ scrapy crawl myspider
[ ... myspider starts crawling ... ]

$ scrapy crawl -o myfile:csv myspider
[ ... myspider starts crawling and appends the result to the file myfile in csv format ..
↪. ]

$ scrapy crawl -O myfile:json myspider
[ ... myspider starts crawling and saves the result in myfile in json format overwriting␣
↪the original content... ]
```

check

- Syntax: `scrapy check [-l] <spider>`
- Requires project: *yes*

Run contract checks.

Usage examples:

```
$ scrapy check -l
first_spider
  * parse
  * parse_item
second_spider
  * parse
  * parse_item

$ scrapy check
```

(continues on next page)

(continued from previous page)

```
[FAILED] first_spider:parse_item
>>> 'RetailPricex' field is missing

[FAILED] first_spider:parse
>>> Returned 92 requests, expected 0..4
```

list

- Syntax: `scrapy list`
- Requires project: *yes*

List all available spiders in the current project. The output is one spider per line.

Usage example:

```
$ scrapy list
spider1
spider2
```

edit

- Syntax: `scrapy edit <spider>`
- Requires project: *yes*

Edit the given spider using the editor defined in the `EDITOR` environment variable or (if unset) the *EDITOR* setting.

This command is provided only as a convenient shortcut for the most common case, the developer is of course free to choose any tool or IDE to write and debug spiders.

Usage example:

```
$ scrapy edit spider1
```

fetch

- Syntax: `scrapy fetch <url>`
- Requires project: *no*

Downloads the given URL using the Scrapy downloader and writes the contents to standard output.

The interesting thing about this command is that it fetches the page the way the spider would download it. For example, if the spider has a `USER_AGENT` attribute which overrides the User Agent, it will use that one.

So this command can be used to "see" how your spider would fetch a certain page.

If used outside a project, no particular per-spider behaviour would be applied and it will just use the default Scrapy downloader settings.

Supported options:

- `--spider=SPIDER`: bypass spider autodetection and force use of specific spider
- `--headers`: print the response's HTTP headers instead of the response's body
- `--no-redirect`: do not follow HTTP 3xx redirects (default is to follow them)

Usage examples:

```
$ scrapy fetch --nolog http://www.example.com/some/page.html
[ ... html content here ... ]

$ scrapy fetch --nolog --headers http://www.example.com/
{'Accept-Ranges': ['bytes'],
 'Age': ['1263   '],
 'Connection': ['close     '],
 'Content-Length': ['596'],
 'Content-Type': ['text/html; charset=UTF-8'],
 'Date': ['Wed, 18 Aug 2010 23:59:46 GMT'],
 'Etag': ['"573c1-254-48c9c87349680"'],
 'Last-Modified': ['Fri, 30 Jul 2010 15:30:18 GMT'],
 'Server': ['Apache/2.2.3 (CentOS)']}
```

view

- Syntax: `scrapy view <url>`
- Requires project: *no*

Opens the given URL in a browser, as your Scrapy spider would "see" it. Sometimes spiders see pages differently from regular users, so this can be used to check what the spider "sees" and confirm it's what you expect.

Supported options:

- `--spider=SPIDER`: bypass spider autodetection and force use of specific spider
- `--no-redirect`: do not follow HTTP 3xx redirects (default is to follow them)

Usage example:

```
$ scrapy view http://www.example.com/some/page.html
[ ... browser starts ... ]
```

shell

- Syntax: `scrapy shell [url]`
- Requires project: *no*

Starts the Scrapy shell for the given URL (if given) or empty if no URL is given. Also supports UNIX-style local file paths, either relative with `./` or `../` prefixes or absolute file paths. See *Scrapy shell* for more info.

Supported options:

- `--spider=SPIDER`: bypass spider autodetection and force use of specific spider
- `-c code`: evaluate the code in the shell, print the result and exit
- `--no-redirect`: do not follow HTTP 3xx redirects (default is to follow them); this only affects the URL you may pass as argument on the command line; once you are inside the shell, `fetch(url)` will still follow HTTP redirects by default.

Usage example:

```
$ scrapy shell http://www.example.com/some/page.html
[ ... scrapy shell starts ... ]

$ scrapy shell --nolog http://www.example.com/ -c '(response.status, response.url)'
```

(continues on next page)

(continued from previous page)

```
(200, 'http://www.example.com/')

# shell follows HTTP redirects by default
$ scrapy shell --nolog http://httpbin.org/redirect-to?url=http%3A%2F%2Fexample.com%2F -c
↪'(response.status, response.url)'
(200, 'http://example.com/')

# you can disable this with --no-redirect
# (only for the URL passed as command line argument)
$ scrapy shell --no-redirect --nolog http://httpbin.org/redirect-to?url=http%3A%2F
↪%2Fexample.com%2F -c '(response.status, response.url)'
(302, 'http://httpbin.org/redirect-to?url=http%3A%2F%2Fexample.com%2F')
```

parse

- Syntax: `scrapy parse <url> [options]`
- Requires project: *yes*

Fetches the given URL and parses it with the spider that handles it, using the method passed with the `--callback` option, or `parse` if not given.

Supported options:

- `--spider=SPIDER`: bypass spider autodetection and force use of specific spider
- `--a NAME=VALUE`: set spider argument (may be repeated)
- `--callback` or `-c`: spider method to use as callback for parsing the response
- `--meta` or `-m`: additional request meta that will be passed to the callback request. This must be a valid json string. Example: –meta='{"foo" : "bar"}'
- `--cbkwargs`: additional keyword arguments that will be passed to the callback. This must be a valid json string. Example: –cbkwargs='{"foo" : "bar"}'
- `--pipelines`: process items through pipelines
- `--rules` or `-r`: use *CrawlSpider* rules to discover the callback (i.e. spider method) to use for parsing the response
- `--noitems`: don't show scraped items
- `--nolinks`: don't show extracted links
- `--nocolour`: avoid using pygments to colorize the output
- `--depth` or `-d`: depth level for which the requests should be followed recursively (default: 1)
- `--verbose` or `-v`: display information for each depth level
- `--output` or `-o`: dump scraped items to a file

  Added in version 2.3.

Usage example:

```
$ scrapy parse http://www.example.com/ -c parse_item
[ ... scrapy log lines crawling example.com spider ... ]

>>> STATUS DEPTH LEVEL 1 <<<
```

(continues on next page)

(continued from previous page)

```
# Scraped Items  ------------------------------------------------------------
[{'name': 'Example item',
 'category': 'Furniture',
 'length': '12 cm'}]

# Requests  -----------------------------------------------------------------
[]
```

settings

- Syntax: `scrapy settings [options]`
- Requires project: *no*

Get the value of a Scrapy setting.

If used inside a project it'll show the project setting value, otherwise it'll show the default Scrapy value for that setting.

Example usage:

```
$ scrapy settings --get BOT_NAME
scrapybot
$ scrapy settings --get DOWNLOAD_DELAY
0
```

runspider

- Syntax: `scrapy runspider <spider_file.py>`
- Requires project: *no*

Run a spider self-contained in a Python file, without having to create a project.

Example usage:

```
$ scrapy runspider myspider.py
[ ... spider starts crawling ... ]
```

version

- Syntax: `scrapy version [-v]`
- Requires project: *no*

Prints the Scrapy version. If used with `-v` it also prints Python, Twisted and Platform info, which is useful for bug reports.

bench

- Syntax: `scrapy bench`
- Requires project: *no*

Run a quick benchmark test. *Benchmarking*.

3.1.6 Custom project commands

You can also add your custom project commands by using the *COMMANDS_MODULE* setting. See the Scrapy commands in scrapy/commands for examples on how to implement your commands.

COMMANDS_MODULE

Default: `''` (empty string)

A module to use for looking up custom Scrapy commands. This is used to add custom commands for your Scrapy project.

Example:

```
COMMANDS_MODULE = "mybot.commands"
```

Register commands via setup.py entry points

You can also add Scrapy commands from an external library by adding a `scrapy.commands` section in the entry points of the library `setup.py` file.

The following example adds `my_command` command:

```
from setuptools import setup, find_packages

setup(
    name="scrapy-mymodule",
    entry_points={
        "scrapy.commands": [
            "my_command=my_scrapy_module.commands:MyCommand",
        ],
    },
)
```

3.2 Spiders

Spiders are classes which define how a certain site (or a group of sites) will be scraped, including how to perform the crawl (i.e. follow links) and how to extract structured data from their pages (i.e. scraping items). In other words, Spiders are the place where you define the custom behaviour for crawling and parsing pages for a particular site (or, in some cases, a group of sites).

For spiders, the scraping cycle goes through something like this:

1. You start by generating the initial requests to crawl the first URLs, and specify a callback function to be called with the response downloaded from those requests.

   The first requests to perform are obtained by iterating the *start()* method, which by default yields a *Request* object for each URL in the *start_urls* spider attribute, with the *parse* method set as *callback* function to handle each *Response*.

2. In the callback function, you parse the response (web page) and return *item objects*, *Request* objects, or an iterable of these objects. Those Requests will also contain a callback (maybe the same) and will then be downloaded by Scrapy and then their response handled by the specified callback.

3. In callback functions, you parse the page contents, typically using *Selectors* (but you can also use BeautifulSoup, lxml or whatever mechanism you prefer) and generate items with the parsed data.

4. Finally, the items returned from the spider will be typically persisted to a database (in some *Item Pipeline*) or written to a file using *Feed exports*.

Even though this cycle applies (more or less) to any kind of spider, there are different kinds of default spiders bundled into Scrapy for different purposes. We will talk about those types here.

3.2.1 scrapy.Spider

class scrapy.spiders.**Spider**

class scrapy.**Spider**(**args: Any*, ***kwargs: Any*)

Base class that any spider must subclass.

It provides a default *start()* implementation that sends requests based on the *start_urls* class attribute and calls the *parse()* method for each response.

name

A string which defines the name for this spider. The spider name is how the spider is located (and instantiated) by Scrapy, so it must be unique. However, nothing prevents you from instantiating more than one instance of the same spider. This is the most important spider attribute and it's required.

If the spider scrapes a single domain, a common practice is to name the spider after the domain, with or without the TLD. So, for example, a spider that crawls `mywebsite.com` would often be called `mywebsite`.

allowed_domains

An optional list of strings containing domains that this spider is allowed to crawl. Requests for URLs not belonging to the domain names specified in this list (or their subdomains) won't be followed if *OffsiteMiddleware* is enabled.

Let's say your target url is `https://www.example.com/1.html`, then add `'example.com'` to the list.

start_urls: list[str]

Start URLs. See *start()*.

custom_settings

A dictionary of settings that will be overridden from the project wide configuration when running this spider. It must be defined as a class attribute since the settings are updated before instantiation.

For a list of available built-in settings see: *Built-in settings reference*.

crawler

This attribute is set by the *from_crawler()* class method after initializing the class, and links to the *Crawler* object to which this spider instance is bound.

Crawlers encapsulate a lot of components in the project for their single entry access (such as extensions, middlewares, signals managers, etc). See *Crawler API* to know more about them.

settings

Configuration for running this spider. This is a *Settings* instance, see the *Settings* topic for a detailed introduction on this subject.

logger

Python logger created with the Spider's *name*. You can use it to send log messages through it as described on *Logging from Spiders*.

state

A dict you can use to persist some spider state between batches. See *Keeping persistent state between batches* to know more about it.

from_crawler(*crawler*, **args*, ***kwargs*)

This is the class method used by Scrapy to create your spiders.

You probably won't need to override this directly because the default implementation acts as a proxy to the *__init__()* method, calling it with the given arguments `args` and named arguments `kwargs`.

Nonetheless, this method sets the *crawler* and *settings* attributes in the new instance so they can be accessed later inside the spider's code.

Changed in version 2.11: The settings in `crawler.settings` can now be modified in this method, which is handy if you want to modify them based on arguments. As a consequence, these settings aren't the final values as they can be modified later by e.g. *add-ons*. For the same reason, most of the *Crawler* attributes aren't initialized at this point.

The final settings and the initialized *Crawler* attributes are available in the *start()* method, handlers of the *engine_started* signal and later.

Parameters

- **crawler** (*Crawler* instance) – crawler to which the spider will be bound
- **args** (*list*) – arguments passed to the *__init__()* method
- **kwargs** (*dict*) – keyword arguments passed to the *__init__()* method

classmethod update_settings(*settings*)

The `update_settings()` method is used to modify the spider's settings and is called during initialization of a spider instance.

It takes a *Settings* object as a parameter and can add or update the spider's configuration values. This method is a class method, meaning that it is called on the *Spider* class and allows all instances of the spider to share the same configuration.

While per-spider settings can be set in *custom_settings*, using `update_settings()` allows you to dynamically add, remove or change settings based on other settings, spider attributes or other factors and use setting priorities other than `'spider'`. Also, it's easy to extend `update_settings()` in a subclass by overriding it, while doing the same with *custom_settings* can be hard.

For example, suppose a spider needs to modify *FEEDS*:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"
    custom_feed = {
        "/home/user/documents/items.json": {
            "format": "json",
            "indent": 4,
        }
    }

    @classmethod
    def update_settings(cls, settings):
        super().update_settings(settings)
        settings.setdefault("FEEDS", {}).update(cls.custom_feed)
```

async start() → AsyncIterator[Any]

Yield the initial *Request* objects to send.

Added in version 2.13.

For example:

```
from scrapy import Request, Spider

class MySpider(Spider):
    name = "myspider"

    async def start(self):
        yield Request("https://toscrape.com/")
```

The default implementation reads URLs from *start_urls* and yields a request for each with *dont_filter* enabled. It is functionally equivalent to:

```
async def start(self):
    for url in self.start_urls:
        yield Request(url, dont_filter=True)
```

You can also yield *items*. For example:

```
async def start(self):
    yield {"foo": "bar"}
```

To write spiders that work on Scrapy versions lower than 2.13, define also a synchronous `start_requests()` method that returns an iterable. For example:

```
def start_requests(self):
    yield Request("https://toscrape.com/")
```

See also

Start requests

parse(*response*)

This is the default callback used by Scrapy to process downloaded responses, when their requests don't specify a callback.

The `parse` method is in charge of processing the response and returning scraped data and/or more URLs to follow. Other Requests callbacks have the same requirements as the *Spider* class.

This method, as well as any other Request callback, must return a *Request* object, an *item object*, an iterable of *Request* objects and/or *item objects*, or `None`.

Parameters
response (*Response*) – the response to parse

log(*message*[, *level*, *component*])

Wrapper that sends a log message through the Spider's *logger*, kept for backward compatibility. For more information see *Logging from Spiders*.

closed(*reason*)

Called when the spider closes. This method provides a shortcut to signals.connect() for the *spider_closed* signal.

Let's see an example:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "example.com"
    allowed_domains = ["example.com"]
    start_urls = [
        "http://www.example.com/1.html",
        "http://www.example.com/2.html",
        "http://www.example.com/3.html",
    ]

    def parse(self, response):
        self.logger.info("A response from %s just arrived!", response.url)
```

Return multiple Requests and items from a single callback:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "example.com"
    allowed_domains = ["example.com"]
    start_urls = [
        "http://www.example.com/1.html",
        "http://www.example.com/2.html",
        "http://www.example.com/3.html",
    ]

    def parse(self, response):
        for h3 in response.xpath("//h3").getall():
            yield {"title": h3}

        for href in response.xpath("//a/@href").getall():
            yield scrapy.Request(response.urljoin(href), self.parse)
```

Instead of *start_urls* you can use *start()* directly; to give data more structure you can use *Item* objects:

```
import scrapy
from myproject.items import MyItem

class MySpider(scrapy.Spider):
    name = "example.com"
    allowed_domains = ["example.com"]

    async def start(self):
        yield scrapy.Request("http://www.example.com/1.html", self.parse)
        yield scrapy.Request("http://www.example.com/2.html", self.parse)
        yield scrapy.Request("http://www.example.com/3.html", self.parse)

    def parse(self, response):
```

(continues on next page)

(continued from previous page)

```
        for h3 in response.xpath("//h3").getall():
            yield MyItem(title=h3)

        for href in response.xpath("//a/@href").getall():
            yield scrapy.Request(response.urljoin(href), self.parse)
```

3.2.2 Spider arguments

Spiders can receive arguments that modify their behaviour. Some common uses for spider arguments are to define the start URLs or to restrict the crawl to certain sections of the site, but they can be used to configure any functionality of the spider.

Spider arguments are passed through the *crawl* command using the `-a` option. For example:

```
scrapy crawl myspider -a category=electronics
```

Spiders can access arguments in their *__init__* methods:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"

    def __init__(self, category=None, *args, **kwargs):
        super(MySpider, self).__init__(*args, **kwargs)
        self.start_urls = [f"http://www.example.com/categories/{category}"]
        # ...
```

The default *__init__* method will take any spider arguments and copy them to the spider as attributes. The above example can also be written as follows:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"

    async def start(self):
        yield scrapy.Request(f"http://www.example.com/categories/{self.category}")
```

If you are *running Scrapy from a script*, you can specify spider arguments when calling *CrawlerProcess.crawl* or *CrawlerRunner.crawl*:

```
process = CrawlerProcess()
process.crawl(MySpider, category="electronics")
```

Keep in mind that spider arguments are only strings. The spider will not do any parsing on its own. If you were to set the `start_urls` attribute from the command line, you would have to parse it on your own into a list using something like `ast.literal_eval()` or `json.loads()` and then set it as an attribute. Otherwise, you would cause iteration over a `start_urls` string (a very common python pitfall) resulting in each character being seen as a separate url.

A valid use case is to set the http auth credentials used by *HttpAuthMiddleware* or the user agent used by *UserAgentMiddleware*:

```
scrapy crawl myspider -a http_user=myuser -a http_pass=mypassword -a user_agent=mybot
```

Spider arguments can also be passed through the Scrapyd `schedule.json` API. See Scrapyd documentation.

3.2.3 Start requests

Start requests are *Request* objects yielded from the *start()* method of a spider or from the *process_start()* method of a *spider middleware*.

See also

Start request order

Delaying start request iteration

You can override the *start()* method as follows to pause its iteration whenever there are scheduled requests:

```
async def start(self):
    async for item_or_request in super().start():
        if self.crawler.engine.needs_backout():
            await self.crawler.signals.wait_for(signals.scheduler_empty)
        yield item_or_request
```

This can help minimize the number of requests in the scheduler at any given time, to minimize resource usage (memory or disk, depending on *JOBDIR*).

3.2.4 Generic Spiders

Scrapy comes with some useful generic spiders that you can use to subclass your spiders from. Their aim is to provide convenient functionality for a few common scraping cases, like following all links on a site based on certain rules, crawling from Sitemaps, or parsing an XML/CSV feed.

For the examples used in the following spiders, we'll assume you have a project with a `TestItem` declared in a `myproject.items` module:

```
import scrapy

class TestItem(scrapy.Item):
    id = scrapy.Field()
    name = scrapy.Field()
    description = scrapy.Field()
```

CrawlSpider

class scrapy.spiders.**CrawlSpider**

This is the most commonly used spider for crawling regular websites, as it provides a convenient mechanism for following links by defining a set of rules. It may not be the best suited for your particular web sites or project, but it's generic enough for several cases, so you can start from it and override it as needed for more custom functionality, or just implement your own spider.

Apart from the attributes inherited from Spider (that you must specify), this class supports a new attribute:

rules

Which is a list of one (or more) *Rule* objects. Each *Rule* defines a certain behaviour for crawling the site. Rules objects are described below. If multiple rules match the same link, the first one will be used, according to the order they're defined in this attribute.

This spider also exposes an overridable method:

parse_start_url(*response*, ***kwargs*)

This method is called for each response produced for the URLs in the spider's `start_urls` attribute. It allows to parse the initial responses and must return either an *item object*, a *Request* object, or an iterable containing any of them.

Crawling rules

class scrapy.spiders.**Rule**(*link_extractor: LinkExtractor | None = None*, *callback: CallbackT | str | None = None*, *cb_kwargs: dict[str, Any] | None = None*, *follow: bool | None = None*, *process_links: ProcessLinksT | str | None = None*, *process_request: ProcessRequestT | str | None = None*, *errback: Callable[[Failure], Any] | str | None = None*)

`link_extractor` is a *Link Extractor* object which defines how links will be extracted from each crawled page. Each produced link will be used to generate a *Request* object, which will contain the link's text in its `meta` dictionary (under the `link_text` key). If omitted, a default link extractor created with no arguments will be used, resulting in all links being extracted.

`callback` is a callable or a string (in which case a method from the spider object with that name will be used) to be called for each link extracted with the specified link extractor. This callback receives a *Response* as its first argument and must return either a single instance or an iterable of *item objects* and/or *Request* objects (or any subclass of them). As mentioned above, the received *Response* object will contain the text of the link that produced the *Request* in its `meta` dictionary (under the `link_text` key)

`cb_kwargs` is a dict containing the keyword arguments to be passed to the callback function.

`follow` is a boolean which specifies if links should be followed from each response extracted with this rule. If `callback` is None `follow` defaults to `True`, otherwise it defaults to `False`.

`process_links` is a callable, or a string (in which case a method from the spider object with that name will be used) which will be called for each list of links extracted from each response using the specified `link_extractor`. This is mainly used for filtering purposes.

`process_request` is a callable (or a string, in which case a method from the spider object with that name will be used) which will be called for every *Request* extracted by this rule. This callable should take said request as first argument and the *Response* from which the request originated as second argument. It must return a `Request` object or `None` (to filter out the request).

`errback` is a callable or a string (in which case a method from the spider object with that name will be used) to be called if any exception is raised while processing a request generated by the rule. It receives a `Twisted Failure` instance as first parameter.

> **Warning**
>
> Because of its internal implementation, you must explicitly set callbacks for new requests when writing *CrawlSpider*-based spiders; unexpected behaviour can occur otherwise.

Added in version 2.0: The *errback* parameter.

CrawlSpider example

Let's now take a look at an example CrawlSpider with rules:

```
import scrapy
from scrapy.spiders import CrawlSpider, Rule
from scrapy.linkextractors import LinkExtractor

class MySpider(CrawlSpider):
    name = "example.com"
    allowed_domains = ["example.com"]
    start_urls = ["http://www.example.com"]

    rules = (
        # Extract links matching 'category.php' (but not matching 'subsection.php')
        # and follow links from them (since no callback means follow=True by default).
        Rule(LinkExtractor(allow=(r"category\.php",), deny=(r"subsection\.php",))),
        # Extract links matching 'item.php' and parse them with the spider's method parse_
↪item
        Rule(LinkExtractor(allow=(r"item\.php",)), callback="parse_item"),
    )

    def parse_item(self, response):
        self.logger.info("Hi, this is an item page! %s", response.url)
        item = scrapy.Item()
        item["id"] = response.xpath('//td[@id="item_id"]/text()').re(r"ID: (\d+)")
        item["name"] = response.xpath('//td[@id="item_name"]/text()').get()
        item["description"] = response.xpath(
            '//td[@id="item_description"]/text()'
        ).get()
        item["link_text"] = response.meta["link_text"]
        url = response.xpath('//td[@id="additional_data"]/@href').get()
        return response.follow(
            url, self.parse_additional_page, cb_kwargs=dict(item=item)
        )

    def parse_additional_page(self, response, item):
        item["additional_data"] = response.xpath(
            '//p[@id="additional_data"]/text()'
        ).get()
        return item
```

This spider would start crawling example.com's home page, collecting category links, and item links, parsing the latter with the `parse_item` method. For each item response, some data will be extracted from the HTML using XPath, and an *Item* will be filled with it.

XMLFeedSpider

class scrapy.spiders.**XMLFeedSpider**

XMLFeedSpider is designed for parsing XML feeds by iterating through them by a certain node name. The iterator can be chosen from: `iternodes`, `xml`, and `html`. It's recommended to use the `iternodes` iterator for performance reasons, since the `xml` and `html` iterators generate the whole DOM at once in order to parse it. However, using `html` as the iterator may be useful when parsing XML with bad markup.

To set the iterator and the tag name, you must define the following class attributes:

iterator

A string which defines the iterator to use. It can be either:

- `'iternodes'` - a fast iterator based on regular expressions
- `'html'` - an iterator which uses *Selector*. Keep in mind this uses DOM parsing and must load all DOM in memory which could be a problem for big feeds
- `'xml'` - an iterator which uses *Selector*. Keep in mind this uses DOM parsing and must load all DOM in memory which could be a problem for big feeds

It defaults to: `'iternodes'`.

itertag

A string with the name of the node (or element) to iterate in. Example:

```
itertag = 'product'
```

namespaces

A list of `(prefix, uri)` tuples which define the namespaces available in that document that will be processed with this spider. The `prefix` and `uri` will be used to automatically register namespaces using the *register_namespace()* method.

You can then specify nodes with namespaces in the *itertag* attribute.

Example:

```
class YourSpider(XMLFeedSpider):

    namespaces = [('n', 'http://www.sitemaps.org/schemas/sitemap/0.9')]
    itertag = 'n:url'
    # ...
```

Apart from these new attributes, this spider has the following overridable methods too:

adapt_response(*response*)

A method that receives the response as soon as it arrives from the spider middleware, before the spider starts parsing it. It can be used to modify the response body before parsing it. This method receives a response and also returns a response (it could be the same or another one).

parse_node(*response*, *selector*)

This method is called for the nodes matching the provided tag name (`itertag`). Receives the response and an *Selector* for each node. Overriding this method is mandatory. Otherwise, you spider won't work. This method must return an *item object*, a *Request* object, or an iterable containing any of them.

process_results(*response*, *results*)

This method is called for each result (item or request) returned by the spider, and it's intended to perform any last time processing required before returning the results to the framework core, for example setting the item IDs. It receives a list of results and the response which originated those results. It must return a list of results (items or requests).

Warning

Because of its internal implementation, you must explicitly set callbacks for new requests when writing *XMLFeedSpider*-based spiders; unexpected behaviour can occur otherwise.

XMLFeedSpider example

These spiders are pretty easy to use, let's have a look at one example:

```
from scrapy.spiders import XMLFeedSpider
from myproject.items import TestItem

class MySpider(XMLFeedSpider):
    name = "example.com"
    allowed_domains = ["example.com"]
    start_urls = ["http://www.example.com/feed.xml"]
    iterator = "iternodes"  # This is actually unnecessary, since it's the default value
    itertag = "item"

    def parse_node(self, response, node):
        self.logger.info(
            "Hi, this is a <%s> node!: %s", self.itertag, "".join(node.getall())
        )

        item = TestItem()
        item["id"] = node.xpath("@id").get()
        item["name"] = node.xpath("name").get()
        item["description"] = node.xpath("description").get()
        return item
```

Basically what we did up there was to create a spider that downloads a feed from the given `start_urls`, and then iterates through each of its `item` tags, prints them out, and stores some random data in an *Item*.

CSVFeedSpider

class scrapy.spiders.**CSVFeedSpider**

This spider is very similar to the XMLFeedSpider, except that it iterates over rows, instead of nodes. The method that gets called in each iteration is *parse_row()*.

delimiter

A string with the separator character for each field in the CSV file Defaults to `','` (comma).

quotechar

A string with the enclosure character for each field in the CSV file Defaults to `'"'` (quotation mark).

headers

A list of the column names in the CSV file.

parse_row(*response*, *row*)

Receives a response and a dict (representing each row) with a key for each provided (or detected) header of the CSV file. This spider also gives the opportunity to override `adapt_response` and `process_results` methods for pre- and post-processing purposes.

CSVFeedSpider example

Let's see an example similar to the previous one, but using a *CSVFeedSpider*:

```
from scrapy.spiders import CSVFeedSpider
from myproject.items import TestItem
```

(continues on next page)

(continued from previous page)

```
class MySpider(CSVFeedSpider):
    name = "example.com"
    allowed_domains = ["example.com"]
    start_urls = ["http://www.example.com/feed.csv"]
    delimiter = ";"
    quotechar = "'"
    headers = ["id", "name", "description"]

    def parse_row(self, response, row):
        self.logger.info("Hi, this is a row!: %r", row)

        item = TestItem()
        item["id"] = row["id"]
        item["name"] = row["name"]
        item["description"] = row["description"]
        return item
```

SitemapSpider

class scrapy.spiders.**SitemapSpider**

SitemapSpider allows you to crawl a site by discovering the URLs using Sitemaps.

It supports nested sitemaps and discovering sitemap urls from robots.txt.

sitemap_urls

A list of urls pointing to the sitemaps whose urls you want to crawl.

You can also point to a robots.txt and it will be parsed to extract sitemap urls from it.

sitemap_rules

A list of tuples `(regex, callback)` where:

- `regex` is a regular expression to match urls extracted from sitemaps. `regex` can be either a str or a compiled regex object.
- callback is the callback to use for processing the urls that match the regular expression. `callback` can be a string (indicating the name of a spider method) or a callable.

For example:

```
sitemap_rules = [('/product/', 'parse_product')]
```

Rules are applied in order, and only the first one that matches will be used.

If you omit this attribute, all urls found in sitemaps will be processed with the `parse` callback.

sitemap_follow

A list of regexes of sitemap that should be followed. This is only for sites that use Sitemap index files that point to other sitemap files.

By default, all sitemaps are followed.

sitemap_alternate_links

Specifies if alternate links for one `url` should be followed. These are links for the same website in another language passed within the same `url` block.

For example:

```
<url>
    <loc>http://example.com/</loc>
    <xhtml:link rel="alternate" hreflang="de" href="http://example.com/de"/>
</url>
```

With `sitemap_alternate_links` set, this would retrieve both URLs. With `sitemap_alternate_links` disabled, only `http://example.com/` would be retrieved.

Default is `sitemap_alternate_links` disabled.

sitemap_filter(*entries*)

This is a filter function that could be overridden to select sitemap entries based on their attributes.

For example:

```
<url>
    <loc>http://example.com/</loc>
    <lastmod>2005-01-01</lastmod>
</url>
```

We can define a `sitemap_filter` function to filter `entries` by date:

```
from datetime import datetime
from scrapy.spiders import SitemapSpider

class FilteredSitemapSpider(SitemapSpider):
    name = "filtered_sitemap_spider"
    allowed_domains = ["example.com"]
    sitemap_urls = ["http://example.com/sitemap.xml"]

    def sitemap_filter(self, entries):
        for entry in entries:
            date_time = datetime.strptime(entry["lastmod"], "%Y-%m-%d")
            if date_time.year >= 2005:
                yield entry
```

This would retrieve only `entries` modified on 2005 and the following years.

Entries are dict objects extracted from the sitemap document. Usually, the key is the tag name and the value is the text inside it.

It's important to notice that:

- as the loc attribute is required, entries without this tag are discarded
- alternate links are stored in a list with the key `alternate` (see `sitemap_alternate_links`)
- namespaces are removed, so lxml tags named as `{namespace}tagname` become only `tagname`

If you omit this method, all entries found in sitemaps will be processed, observing other attributes and their settings.

SitemapSpider examples

Simplest example: process all urls discovered through sitemaps using the `parse` callback:

```
from scrapy.spiders import SitemapSpider

class MySpider(SitemapSpider):
    sitemap_urls = ["http://www.example.com/sitemap.xml"]

    def parse(self, response):
        pass  # ... scrape item here ...
```

Process some urls with certain callback and other urls with a different callback:

```
from scrapy.spiders import SitemapSpider

class MySpider(SitemapSpider):
    sitemap_urls = ["http://www.example.com/sitemap.xml"]
    sitemap_rules = [
        ("/product/", "parse_product"),
        ("/category/", "parse_category"),
    ]

    def parse_product(self, response):
        pass  # ... scrape product ...

    def parse_category(self, response):
        pass  # ... scrape category ...
```

Follow sitemaps defined in the robots.txt file and only follow sitemaps whose url contains `/sitemap_shop`:

```
from scrapy.spiders import SitemapSpider

class MySpider(SitemapSpider):
    sitemap_urls = ["http://www.example.com/robots.txt"]
    sitemap_rules = [
        ("/shop/", "parse_shop"),
    ]
    sitemap_follow = ["/sitemap_shops"]

    def parse_shop(self, response):
        pass  # ... scrape shop here ...
```

Combine SitemapSpider with other sources of urls:

```
from scrapy.spiders import SitemapSpider

class MySpider(SitemapSpider):
    sitemap_urls = ["http://www.example.com/robots.txt"]
    sitemap_rules = [
```

(continues on next page)

(continued from previous page)

```
        ("/shop/", "parse_shop"),
    ]

    other_urls = ["http://www.example.com/about"]

    async def start(self):
        async for item_or_request in super().start():
            yield item_or_request
        for url in self.other_urls:
            yield Request(url, self.parse_other)

    def parse_shop(self, response):
        pass  # ... scrape shop here ...

    def parse_other(self, response):
        pass  # ... scrape other here ...
```

3.3 Selectors

When you're scraping web pages, the most common task you need to perform is to extract data from the HTML source. There are several libraries available to achieve this, such as:

- BeautifulSoup is a very popular web scraping library among Python programmers which constructs a Python object based on the structure of the HTML code and also deals with bad markup reasonably well, but it has one drawback: it's slow.
- lxml is an XML parsing library (which also parses HTML) with a pythonic API based on `ElementTree`. (lxml is not part of the Python standard library.)

Scrapy comes with its own mechanism for extracting data. They're called selectors because they "select" certain parts of the HTML document specified either by XPath or CSS expressions.

XPath is a language for selecting nodes in XML documents, which can also be used with HTML. CSS is a language for applying styles to HTML documents. It defines selectors to associate those styles with specific HTML elements.

> **Note**
>
> Scrapy Selectors is a thin wrapper around parsel library; the purpose of this wrapper is to provide better integration with Scrapy Response objects.
>
> parsel is a stand-alone web scraping library which can be used without Scrapy. It uses lxml library under the hood, and implements an easy API on top of lxml API. It means Scrapy selectors are very similar in speed and parsing accuracy to lxml.

3.3.1 Using selectors

Constructing selectors

Response objects expose a *`Selector`* instance on `.selector` attribute:

```
>>> response.selector.xpath("//span/text()").get()
'good'
```

Querying responses using XPath and CSS is so common that responses include two more shortcuts: `response.xpath()` and `response.css()`:

```
>>> response.xpath("//span/text()").get()
'good'
>>> response.css("span::text").get()
'good'
```

Scrapy selectors are instances of *Selector* class constructed by passing either *TextResponse* object or markup as a string (in `text` argument).

Usually there is no need to construct Scrapy selectors manually: `response` object is available in Spider callbacks, so in most cases it is more convenient to use `response.css()` and `response.xpath()` shortcuts. By using `response.selector` or one of these shortcuts you can also ensure the response body is parsed only once.

But if required, it is possible to use `Selector` directly. Constructing from text:

```
>>> from scrapy.selector import Selector
>>> body = "<html><body><span>good</span></body></html>"
>>> Selector(text=body).xpath("//span/text()").get()
'good'
```

Constructing from response - *HtmlResponse* is one of *TextResponse* subclasses:

```
>>> from scrapy.selector import Selector
>>> from scrapy.http import HtmlResponse
>>> response = HtmlResponse(url="http://example.com", body=body, encoding="utf-8")
>>> Selector(response=response).xpath("//span/text()").get()
'good'
```

`Selector` automatically chooses the best parsing rules (XML vs HTML) based on input type.

Using selectors

To explain how to use the selectors we'll use the `Scrapy shell` (which provides interactive testing) and an example page located in the Scrapy documentation server:

> https://docs.scrapy.org/en/latest/_static/selectors-sample1.html

For the sake of completeness, here's its full HTML code:

```
<!DOCTYPE html>

<html>
  <head>
    <base href='http://example.com/' />
    <title>Example website</title>
  </head>
  <body>
    <div id='images'>
      <a href='image1.html'>Name: My image 1 <br /><img src='image1_thumb.jpg' alt=
↪'image1'/></a>
      <a href='image2.html'>Name: My image 2 <br /><img src='image2_thumb.jpg' alt=
↪'image2'/></a>
      <a href='image3.html'>Name: My image 3 <br /><img src='image3_thumb.jpg' alt=
↪'image3'/></a>
```

(continues on next page)

(continued from previous page)

```
      <a href='image4.html'>Name: My image 4 <br /><img src='image4_thumb.jpg' alt=
↪'image4'/></a>
      <a href='image5.html'>Name: My image 5 <br /><img src='image5_thumb.jpg' alt=
↪'image5'/></a>
    </div>
  </body>
</html>
```

First, let's open the shell:

```
scrapy shell https://docs.scrapy.org/en/latest/_static/selectors-sample1.html
```

Then, after the shell loads, you'll have the response available as `response` shell variable, and its attached selector in `response.selector` attribute.

Since we're dealing with HTML, the selector will automatically use an HTML parser.

So, by looking at the *HTML code* of that page, let's construct an XPath for selecting the text inside the title tag:

```
>>> response.xpath("//title/text()")
[<Selector query='//title/text()' data='Example website'>]
```

To actually extract the textual data, you must call the selector `.get()` or `.getall()` methods, as follows:

```
>>> response.xpath("//title/text()").getall()
['Example website']
>>> response.xpath("//title/text()").get()
'Example website'
```

`.get()` always returns a single result; if there are several matches, content of a first match is returned; if there are no matches, None is returned. `.getall()` returns a list with all results.

Notice that CSS selectors can select text or attribute nodes using CSS3 pseudo-elements:

```
>>> response.css("title::text").get()
'Example website'
```

As you can see, `.xpath()` and `.css()` methods return a *SelectorList* instance, which is a list of new selectors. This API can be used for quickly selecting nested data:

```
>>> response.css("img").xpath("@src").getall()
['image1_thumb.jpg',
'image2_thumb.jpg',
'image3_thumb.jpg',
'image4_thumb.jpg',
'image5_thumb.jpg']
```

If you want to extract only the first matched element, you can call the selector `.get()` (or its alias `.extract_first()` commonly used in previous Scrapy versions):

```
>>> response.xpath('//div[@id="images"]/a/text()').get()
'Name: My image 1 '
```

It returns `None` if no element was found:

```
>>> response.xpath('//div[@id="not-exists"]/text()').get() is None
True
```

A default return value can be provided as an argument, to be used instead of `None`:

```
>>> response.xpath('//div[@id="not-exists"]/text()').get(default="not-found")
'not-found'
```

Instead of using e.g. `'@src'` XPath it is possible to query for attributes using `.attrib` property of a *Selector*:

```
>>> [img.attrib["src"] for img in response.css("img")]
['image1_thumb.jpg',
'image2_thumb.jpg',
'image3_thumb.jpg',
'image4_thumb.jpg',
'image5_thumb.jpg']
```

As a shortcut, `.attrib` is also available on SelectorList directly; it returns attributes for the first matching element:

```
>>> response.css("img").attrib["src"]
'image1_thumb.jpg'
```

This is most useful when only a single result is expected, e.g. when selecting by id, or selecting unique elements on a web page:

```
>>> response.css("base").attrib["href"]
'http://example.com/'
```

Now we're going to get the base URL and some image links:

```
>>> response.xpath("//base/@href").get()
'http://example.com/'

>>> response.css("base::attr(href)").get()
'http://example.com/'

>>> response.css("base").attrib["href"]
'http://example.com/'

>>> response.xpath('//a[contains(@href, "image")]/@href').getall()
['image1.html',
'image2.html',
'image3.html',
'image4.html',
'image5.html']

>>> response.css("a[href*=image]::attr(href)").getall()
['image1.html',
'image2.html',
'image3.html',
'image4.html',
'image5.html']

>>> response.xpath('//a[contains(@href, "image")]/img/@src').getall()
```

(continues on next page)

(continued from previous page)

```
['image1_thumb.jpg',
'image2_thumb.jpg',
'image3_thumb.jpg',
'image4_thumb.jpg',
'image5_thumb.jpg']

>>> response.css("a[href*=image] img::attr(src)").getall()
['image1_thumb.jpg',
'image2_thumb.jpg',
'image3_thumb.jpg',
'image4_thumb.jpg',
'image5_thumb.jpg']
```

Extensions to CSS Selectors

Per W3C standards, CSS selectors do not support selecting text nodes or attribute values. But selecting these is so essential in a web scraping context that Scrapy (parsel) implements a couple of **non-standard pseudo-elements**:

- to select text nodes, use `::text`
- to select attribute values, use `::attr(name)` where *name* is the name of the attribute that you want the value of

> **Warning**
>
> These pseudo-elements are Scrapy-/Parsel-specific. They will most probably not work with other libraries like lxml or PyQuery.

Examples:

- `title::text` selects children text nodes of a descendant <title> element:

```
>>> response.css("title::text").get()
'Example website'
```

- `*::text` selects all descendant text nodes of the current selector context:

```
>>> response.css("#images *::text").getall()
['\n   ',
'Name: My image 1 ',
'\n   ',
'Name: My image 2 ',
'\n   ',
'Name: My image 3 ',
'\n   ',
'Name: My image 4 ',
'\n   ',
'Name: My image 5 ',
'\n  ']
```

- `foo::text` returns no results if `foo` element exists, but contains no text (i.e. text is empty):

```
>>> response.css("img::text").getall()
[]
```

(continues on next page)

(continued from previous page)

```
This means ``.css('foo::text').get()`` could return None even if an element
exists. Use ``default=''`` if you always want a string:
```

```
>>> response.css("img::text").get()
>>> response.css("img::text").get(default="")
''
```

- `a::attr(href)` selects the *href* attribute value of descendant links:

```
>>> response.css("a::attr(href)").getall()
['image1.html',
'image2.html',
'image3.html',
'image4.html',
'image5.html']
```

Note

See also: *Selecting element attributes*.

Note

You cannot chain these pseudo-elements. But in practice it would not make much sense: text nodes do not have attributes, and attribute values are string values already and do not have children nodes.

Nesting selectors

The selection methods (`.xpath()` or `.css()`) return a list of selectors of the same type, so you can call the selection methods for those selectors too. Here's an example:

```
>>> links = response.xpath('//a[contains(@href, "image")]')
>>> links.getall()
['<a href="image1.html">Name: My image 1 <br><img src="image1_thumb.jpg" alt="image1"></
↪a>',
'<a href="image2.html">Name: My image 2 <br><img src="image2_thumb.jpg" alt="image2"></a>
↪',
'<a href="image3.html">Name: My image 3 <br><img src="image3_thumb.jpg" alt="image3"></a>
↪',
'<a href="image4.html">Name: My image 4 <br><img src="image4_thumb.jpg" alt="image4"></a>
↪',
'<a href="image5.html">Name: My image 5 <br><img src="image5_thumb.jpg" alt="image5"></a>
↪']

>>> for index, link in enumerate(links):
...     href_xpath = link.xpath("@href").get()
...     img_xpath = link.xpath("img/@src").get()
...     print(f"Link number {index} points to url {href_xpath!r} and image {img_xpath!r}
↪")
```

(continues on next page)

(continued from previous page)

```
...
Link number 0 points to url 'image1.html' and image 'image1_thumb.jpg'
Link number 1 points to url 'image2.html' and image 'image2_thumb.jpg'
Link number 2 points to url 'image3.html' and image 'image3_thumb.jpg'
Link number 3 points to url 'image4.html' and image 'image4_thumb.jpg'
Link number 4 points to url 'image5.html' and image 'image5_thumb.jpg'
```

Selecting element attributes

There are several ways to get a value of an attribute. First, one can use XPath syntax:

```
>>> response.xpath("//a/@href").getall()
['image1.html', 'image2.html', 'image3.html', 'image4.html', 'image5.html']
```

XPath syntax has a few advantages: it is a standard XPath feature, and `@attributes` can be used in other parts of an XPath expression - e.g. it is possible to filter by attribute value.

Scrapy also provides an extension to CSS selectors (`::attr(...)`) which allows to get attribute values:

```
>>> response.css("a::attr(href)").getall()
['image1.html', 'image2.html', 'image3.html', 'image4.html', 'image5.html']
```

In addition to that, there is a `.attrib` property of Selector. You can use it if you prefer to lookup attributes in Python code, without using XPaths or CSS extensions:

```
>>> [a.attrib["href"] for a in response.css("a")]
['image1.html', 'image2.html', 'image3.html', 'image4.html', 'image5.html']
```

This property is also available on SelectorList; it returns a dictionary with attributes of a first matching element. It is convenient to use when a selector is expected to give a single result (e.g. when selecting by element ID, or when selecting an unique element on a page):

```
>>> response.css("base").attrib
{'href': 'http://example.com/'}
>>> response.css("base").attrib["href"]
'http://example.com/'
```

`.attrib` property of an empty SelectorList is empty:

```
>>> response.css("foo").attrib
{}
```

Using selectors with regular expressions

Selector also has a `.re()` method for extracting data using regular expressions. However, unlike using `.xpath()` or `.css()` methods, `.re()` returns a list of strings. So you can't construct nested `.re()` calls.

Here's an example used to extract image names from the *HTML code* above:

```
>>> response.xpath('//a[contains(@href, "image")]/text()').re(r"Name:\s*(.*)")
['My image 1 ',
'My image 2 ',
'My image 3 ',
```

(continues on next page)

(continued from previous page)

```
'My image 4 ',
'My image 5 ']
```

There's an additional helper reciprocating `.get()` (and its alias `.extract_first()`) for `.re()`, named `.re_first()`. Use it to extract just the first matching string:

```
>>> response.xpath('//a[contains(@href, "image")]/text()').re_first(r"Name:\s*(.*)")
'My image 1 '
```

extract() and extract_first()

If you're a long-time Scrapy user, you're probably familiar with `.extract()` and `.extract_first()` selector methods. Many blog posts and tutorials are using them as well. These methods are still supported by Scrapy, there are **no plans** to deprecate them.

However, Scrapy usage docs are now written using `.get()` and `.getall()` methods. We feel that these new methods result in a more concise and readable code.

The following examples show how these methods map to each other.

1. `SelectorList.get()` is the same as `SelectorList.extract_first()`:

```
>>> response.css("a::attr(href)").get()
'image1.html'
>>> response.css("a::attr(href)").extract_first()
'image1.html'
```

2. `SelectorList.getall()` is the same as `SelectorList.extract()`:

```
>>> response.css("a::attr(href)").getall()
['image1.html', 'image2.html', 'image3.html', 'image4.html', 'image5.html']
>>> response.css("a::attr(href)").extract()
['image1.html', 'image2.html', 'image3.html', 'image4.html', 'image5.html']
```

3. `Selector.get()` is the same as `Selector.extract()`:

```
>>> response.css("a::attr(href)")[0].get()
'image1.html'
>>> response.css("a::attr(href)")[0].extract()
'image1.html'
```

4. For consistency, there is also `Selector.getall()`, which returns a list:

```
>>> response.css("a::attr(href)")[0].getall()
['image1.html']
```

So, the main difference is that output of `.get()` and `.getall()` methods is more predictable: `.get()` always returns a single result, `.getall()` always returns a list of all extracted results. With `.extract()` method it was not always obvious if a result is a list or not; to get a single result either `.extract()` or `.extract_first()` should be called.

3.3.2 Working with XPaths

Here are some tips which may help you to use XPath with Scrapy selectors effectively. If you are not much familiar with XPath yet, you may want to take a look first at this XPath tutorial.

> **Note**
>
> Some of the tips are based on this post from Zyte's blog.

Working with relative XPaths

Keep in mind that if you are nesting selectors and use an XPath that starts with /, that XPath will be absolute to the document and not relative to the `Selector` you're calling it from.

For example, suppose you want to extract all <p> elements inside elements. First, you would get all elements:

```
>>> divs = response.xpath("//div")
```

At first, you may be tempted to use the following approach, which is wrong, as it actually extracts all <p> elements from the document, not only those inside elements:

```
>>> for p in divs.xpath("//p"):  # this is wrong - gets all <p> from the whole document
...     print(p.get())
...
```

This is the proper way to do it (note the dot prefixing the `.//p` XPath):

```
>>> for p in divs.xpath(".//p"):  # extracts all <p> inside
...     print(p.get())
...
```

Another common case would be to extract all direct <p> children:

```
>>> for p in divs.xpath("p"):
...     print(p.get())
...
```

For more details about relative XPaths see the Location Paths section in the XPath specification.

When querying by class, consider using CSS

Because an element can contain multiple CSS classes, the XPath way to select elements by class is the rather verbose:

```
*[contains(concat(' ', normalize-space(@class), ' '), ' someclass ')]
```

If you use `@class='someclass'` you may end up missing elements that have other classes, and if you just use `contains(@class, 'someclass')` to make up for that you may end up with more elements that you want, if they have a different class name that shares the string `someclass`.

As it turns out, Scrapy selectors allow you to chain selectors, so most of the time you can just select by class using CSS and then switch to XPath when needed:

```
>>> from scrapy import Selector
>>> sel = Selector(
...     text='<div class="hero shout"><time datetime="2014-07-23 19:00">Special date</
↪time></div>'
... )
>>> sel.css(".shout").xpath("./time/@datetime").getall()
['2014-07-23 19:00']
```

This is cleaner than using the verbose XPath trick shown above. Just remember to use the `.` in the XPath expressions that will follow.

Beware of the difference between //node[1] and (//node)[1]

`//node[1]` selects all the nodes occurring first under their respective parents.

`(//node)[1]` selects all the nodes in the document, and then gets only the first of them.

Example:

```
>>> from scrapy import Selector
>>> sel = Selector(
...     text="""
...     <ul class="list">
...         <li>1</li>
...         <li>2</li>
...         <li>3</li>
...     </ul>
...     <ul class="list">
...         <li>4</li>
...         <li>5</li>
...         <li>6</li>
...     </ul>"""
... )
>>> xp = lambda x: sel.xpath(x).getall()
```

This gets all first <li> elements under whatever it is its parent:

```
>>> xp("//li[1]")
['<li>1</li>', '<li>4</li>']
```

And this gets the first <li> element in the whole document:

```
>>> xp("(//li)[1]")
['<li>1</li>']
```

This gets all first <li> elements under an <ul> parent:

```
>>> xp("//ul/li[1]")
['<li>1</li>', '<li>4</li>']
```

And this gets the first <li> element under an <ul> parent in the whole document:

```
>>> xp("(//ul/li)[1]")
['<li>1</li>']
```

Using text nodes in a condition

When you need to use the text content as argument to an XPath string function, avoid using `.//text()` and use just `.` instead.

This is because the expression `.//text()` yields a collection of text elements – a *node-set*. And when a node-set is converted to a string, which happens when it is passed as argument to a string function like `contains()` or `starts-with()`, it results in the text for the first element only.

Example:

```
>>> from scrapy import Selector
>>> sel = Selector(
...     text='<a href="#">Click here to go to the <strong>Next Page</strong></a>'
... )
```

Converting a *node-set* to string:

```
>>> sel.xpath("//a//text()").getall()  # take a peek at the node-set
['Click here to go to the ', 'Next Page']
>>> sel.xpath("string(//a[1]//text())").getall()  # convert it to string
['Click here to go to the ']
```

A *node* converted to a string, however, puts together the text of itself plus of all its descendants:

```
>>> sel.xpath("//a[1]").getall()  # select the first node
['<a href="#">Click here to go to the <strong>Next Page</strong></a>']
>>> sel.xpath("string(//a[1])").getall()  # convert it to string
['Click here to go to the Next Page']
```

So, using the `.//text()` node-set won't select anything in this case:

```
>>> sel.xpath("//a[contains(.//text(), 'Next Page')]").getall()
[]
```

But using the `.` to mean the node, works:

```
>>> sel.xpath("//a[contains(., 'Next Page')]").getall()
['<a href="#">Click here to go to the <strong>Next Page</strong></a>']
```

Variables in XPath expressions

XPath allows you to reference variables in your XPath expressions, using the `$somevariable` syntax. This is somewhat similar to parameterized queries or prepared statements in the SQL world where you replace some arguments in your queries with placeholders like `?`, which are then substituted with values passed with the query.

Here's an example to match an element based on its "id" attribute value, without hard-coding it (that was shown previously):

```
>>> # `$val` used in the expression, a `val` argument needs to be passed
>>> response.xpath("//div[@id=$val]/a/text()", val="images").get()
'Name: My image 1 '
```

Here's another example, to find the "id" attribute of a `<div>` tag containing five `<a>` children (here we pass the value `5` as an integer):

```
>>> response.xpath("//div[count(a)=$cnt]/@id", cnt=5).get()
'images'
```

All variable references must have a binding value when calling `.xpath()` (otherwise you'll get a `ValueError: XPath error:` exception). This is done by passing as many named arguments as necessary.

parsel, the library powering Scrapy selectors, has more details and examples on XPath variables.

Removing namespaces

When dealing with scraping projects, it is often quite convenient to get rid of namespaces altogether and just work with element names, to write more simple/convenient XPaths. You can use the *Selector.remove_namespaces()* method for that.

Let's show an example that illustrates this with the Python Insider blog atom feed.

First, we open the shell with the url we want to scrape:

```
$ scrapy shell https://feeds.feedburner.com/PythonInsider
```

This is how the file starts:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet ...
<feed xmlns="http://www.w3.org/2005/Atom"
      xmlns:openSearch="http://a9.com/-/spec/opensearchrss/1.0/"
      xmlns:blogger="http://schemas.google.com/blogger/2008"
      xmlns:georss="http://www.georss.org/georss"
      xmlns:gd="http://schemas.google.com/g/2005"
      xmlns:thr="http://purl.org/syndication/thread/1.0"
      xmlns:feedburner="http://rssnamespace.org/feedburner/ext/1.0">
  ...
```

You can see several namespace declarations including a default `"http://www.w3.org/2005/Atom"` and another one using the `gd:` prefix for `"http://schemas.google.com/g/2005"`.

Once in the shell we can try selecting all `<link>` objects and see that it doesn't work (because the Atom XML namespace is obfuscating those nodes):

```
>>> response.xpath("//link")
[]
```

But once we call the *Selector.remove_namespaces()* method, all nodes can be accessed directly by their names:

```
>>> response.selector.remove_namespaces()
>>> response.xpath("//link")
[<Selector query='//link' data='<link rel="alternate" type="text/html" h'>,
    <Selector query='//link' data='<link rel="next" type="application/atom+'>,
    ...
```

If you wonder why the namespace removal procedure isn't always called by default instead of having to call it manually, this is because of two reasons, which, in order of relevance, are:

1. Removing namespaces requires to iterate and modify all nodes in the document, which is a reasonably expensive operation to perform by default for all documents crawled by Scrapy
2. There could be some cases where using namespaces is actually required, in case some element names clash between namespaces. These cases are very rare though.

Using EXSLT extensions

Being built atop lxml, Scrapy selectors support some EXSLT extensions and come with these pre-registered namespaces to use in XPath expressions:

prefix	namespace	usage
re	http://exslt.org/regular-expressions	regular expressions
set	http://exslt.org/sets	set manipulation

Regular expressions

The `test()` function, for example, can prove quite useful when XPath's `starts-with()` or `contains()` are not sufficient.

Example selecting links in list item with a "class" attribute ending with a digit:

```
>>> from scrapy import Selector
>>> doc = """
... <div>
...     <ul>
...         <li class="item-0"><a href="link1.html">first item</a></li>
...         <li class="item-1"><a href="link2.html">second item</a></li>
...         <li class="item-inactive"><a href="link3.html">third item</a></li>
...         <li class="item-1"><a href="link4.html">fourth item</a></li>
...         <li class="item-0"><a href="link5.html">fifth item</a></li>
...     </ul>
... </div>
... """
>>> sel = Selector(text=doc, type="html")
>>> sel.xpath("//li//@href").getall()
['link1.html', 'link2.html', 'link3.html', 'link4.html', 'link5.html']
>>> sel.xpath('//li[re:test(@class, "item-\d$")]//@href').getall()
['link1.html', 'link2.html', 'link4.html', 'link5.html']
```

Warning

C library `libxslt` doesn't natively support EXSLT regular expressions so lxml's implementation uses hooks to Python's `re` module. Thus, using regexp functions in your XPath expressions may add a small performance penalty.

Set operations

These can be handy for excluding parts of a document tree before extracting text elements for example.

Example extracting microdata (sample content taken from https://schema.org/Product) with groups of itemscopes and corresponding itemprops:

```
>>> doc = """
... <div itemscope itemtype="http://schema.org/Product">
...   <span itemprop="name">Kenmore White 17" Microwave</span>
...   <img src="kenmore-microwave-17in.jpg" alt='Kenmore 17" Microwave' />
...   <div itemprop="aggregateRating"
...     itemscope itemtype="http://schema.org/AggregateRating">
...    Rated <span itemprop="ratingValue">3.5</span>/5
...    based on <span itemprop="reviewCount">11</span> customer reviews
...   </div>
...   <div itemprop="offers" itemscope itemtype="http://schema.org/Offer">
```

(continues on next page)

(continued from previous page)

```
...     <span itemprop="price">$55.00</span>
...     <link itemprop="availability" href="http://schema.org/InStock" />In stock
...   </div>
...   Product description:
...   <span itemprop="description">0.7 cubic feet countertop microwave.
...   Has six preset cooking categories and convenience features like
...   Add-A-Minute and Child Lock.</span>
...   Customer reviews:
...   <div itemprop="review" itemscope itemtype="http://schema.org/Review">
...     <span itemprop="name">Not a happy camper</span> -
...     by <span itemprop="author">Ellie</span>,
...     <meta itemprop="datePublished" content="2011-04-01">April 1, 2011
...     <div itemprop="reviewRating" itemscope itemtype="http://schema.org/Rating">
...       <meta itemprop="worstRating" content = "1">
...       <span itemprop="ratingValue">1</span>/
...       <span itemprop="bestRating">5</span>stars
...     </div>
...     <span itemprop="description">The lamp burned out and now I have to replace
...     it. </span>
...   </div>
...   <div itemprop="review" itemscope itemtype="http://schema.org/Review">
...     <span itemprop="name">Value purchase</span> -
...     by <span itemprop="author">Lucas</span>,
...     <meta itemprop="datePublished" content="2011-03-25">March 25, 2011
...     <div itemprop="reviewRating" itemscope itemtype="http://schema.org/Rating">
...       <meta itemprop="worstRating" content = "1"/>
...       <span itemprop="ratingValue">4</span>/
...       <span itemprop="bestRating">5</span>stars
...     </div>
...     <span itemprop="description">Great microwave for the price. It is small and
...     fits in my apartment.</span>
...   </div>
...   ...
... </div>
... """
>>> sel = Selector(text=doc, type="html")
>>> for scope in sel.xpath("//div[@itemscope]"):
...     print("current scope:", scope.xpath("@itemtype").getall())
...     props = scope.xpath(
...         """
...                 set:difference(./descendant::*/@itemprop,
...                                .//*[@itemscope]/*/@itemprop)"""
...     )
...     print(f"    properties: {props.getall()}")
...     print("")
...

current scope: ['http://schema.org/Product']
    properties: ['name', 'aggregateRating', 'offers', 'description', 'review', 'review']

current scope: ['http://schema.org/AggregateRating']
    properties: ['ratingValue', 'reviewCount']
```

(continues on next page)

(continued from previous page)

```
current scope: ['http://schema.org/Offer']
    properties: ['price', 'availability']

current scope: ['http://schema.org/Review']
    properties: ['name', 'author', 'datePublished', 'reviewRating', 'description']

current scope: ['http://schema.org/Rating']
    properties: ['worstRating', 'ratingValue', 'bestRating']

current scope: ['http://schema.org/Review']
    properties: ['name', 'author', 'datePublished', 'reviewRating', 'description']

current scope: ['http://schema.org/Rating']
    properties: ['worstRating', 'ratingValue', 'bestRating']
```

Here we first iterate over `itemscope` elements, and for each one, we look for all `itemprops` elements and exclude those that are themselves inside another `itemscope`.

Other XPath extensions

Scrapy selectors also provide a sorely missed XPath extension function `has-class` that returns `True` for nodes that have all of the specified HTML classes.

For the following HTML:

```
>>> from scrapy.http import HtmlResponse
>>> response = HtmlResponse(
...     url="http://example.com",
...     body="""
... <html>
...     <body>
...         <p class="foo bar-baz">First</p>
...         <p class="foo">Second</p>
...         <p class="bar">Third</p>
...         <p>Fourth</p>
...     </body>
... </html>
... """,
...     encoding="utf-8",
... )
```

You can use it like this:

```
>>> response.xpath('//p[has-class("foo")]')
[<Selector query='//p[has-class("foo")]' data='<p class="foo bar-baz">First</p>'>,
<Selector query='//p[has-class("foo")]' data='<p class="foo">Second</p>'>]
>>> response.xpath('//p[has-class("foo", "bar-baz")]')
[<Selector query='//p[has-class("foo", "bar-baz")]' data='<p class="foo bar-baz">First</
↪p>'>]
>>> response.xpath('//p[has-class("foo", "bar")]')
[]
```

So XPath `//p[has-class("foo", "bar-baz")]` is roughly equivalent to CSS `p.foo.bar-baz`. Please note, that

it is slower in most of the cases, because it's a pure-Python function that's invoked for every node in question whereas the CSS lookup is translated into XPath and thus runs more efficiently, so performance-wise its uses are limited to situations that are not easily described with CSS selectors.

Parsel also simplifies adding your own XPath extensions with `set_xpathfunc()`.

3.3.3 Built-in Selectors reference

Selector objects

class scrapy.**Selector**(**args: Any*, ***kwargs: Any*)

An instance of *Selector* is a wrapper over response to select certain parts of its content.

`response` is an *HtmlResponse* or an *XmlResponse* object that will be used for selecting and extracting data.

`text` is a unicode string or utf-8 encoded text for cases when a `response` isn't available. Using `text` and `response` together is undefined behavior.

`type` defines the selector type, it can be `"html"`, `"xml"`, `"json"` or `None` (default).

If `type` is `None`, the selector automatically chooses the best type based on `response` type (see below), or defaults to `"html"` in case it is used together with `text`.

If `type` is `None` and a `response` is passed, the selector type is inferred from the response type as follows:

- `"html"` for *HtmlResponse* type
- `"xml"` for *XmlResponse* type
- `"json"` for *TextResponse* type
- `"html"` for anything else

Otherwise, if `type` is set, the selector type will be forced and no detection will occur.

xpath(*query: str*, *namespaces: Mapping[str, str] | None = None*, ***kwargs: Any*) → SelectorList[_SelectorType]

Find nodes matching the xpath `query` and return the result as a `SelectorList` instance with all elements flattened. List elements implement *Selector* interface too.

`query` is a string containing the XPATH query to apply.

`namespaces` is an optional `prefix: namespace-uri` mapping (dict) for additional prefixes to those registered with `register_namespace(prefix, uri)`. Contrary to `register_namespace()`, these prefixes are not saved for future calls.

Any additional named arguments can be used to pass values for XPath variables in the XPath expression, e.g.:

```
selector.xpath('//a[href=$url]', url="http://www.example.com")
```

> **Note**
>
> For convenience, this method can be called as `response.xpath()`

css(*query: str*) → SelectorList[_SelectorType]

Apply the given CSS selector and return a `SelectorList` instance.

`query` is a string containing the CSS selector to apply.

In the background, CSS queries are translated into XPath queries using cssselect library and run `.xpath()` method.

> **Note**
>
> For convenience, this method can be called as `response.css()`

jmespath(*query: str*, ***kwargs: Any*) → SelectorList[_SelectorType]

Find objects matching the JMESPath `query` and return the result as a `SelectorList` instance with all elements flattened. List elements implement *Selector* interface too.

`query` is a string containing the JMESPath query to apply.

Any additional named arguments are passed to the underlying `jmespath.search` call, e.g.:

```
selector.jmespath('author.name', options=jmespath.Options(dict_cls=collections.
↪OrderedDict))
```

> **Note**
>
> For convenience, this method can be called as `response.jmespath()`

get() → Any

Serialize and return the matched nodes.

For HTML and XML, the result is always a string, and percent-encoded content is unquoted.

See also: *extract() and extract_first()*

attrib

Return the attributes dictionary for underlying element.

See also: *Selecting element attributes*.

re(*regex: str | Pattern[str]*, *replace_entities: bool = True*) → List[str]

Apply the given regex and return a list of strings with the matches.

`regex` can be either a compiled regular expression or a string which will be compiled to a regular expression using `re.compile(regex)`.

By default, character entity references are replaced by their corresponding character (except for `&` and `<`). Passing `replace_entities` as `False` switches off these replacements.

re_first(*regex: str | Pattern[str]*, *default: None = None*, *replace_entities: bool = True*) → str | None

re_first(*regex: str | Pattern[str]*, *default: str*, *replace_entities: bool = True*) → str

Apply the given regex and return the first string which matches. If there is no match, return the default value (`None` if the argument is not provided).

By default, character entity references are replaced by their corresponding character (except for `&` and `<`). Passing `replace_entities` as `False` switches off these replacements.

register_namespace(*prefix: str*, *uri: str*) → None

Register the given namespace to be used in this *Selector*. Without registering namespaces you can't select or extract data from non-standard namespaces. See *Selector examples on XML response*.

remove_namespaces() → None

Remove all namespaces, allowing to traverse the document using namespace-less xpaths. See *Removing namespaces*.

__bool__() → bool

Return `True` if there is any real content selected or `False` otherwise. In other words, the boolean value of a *Selector* is given by the contents it selects.

getall() → List[str]

Serialize and return the matched node in a 1-element list of strings.

This method is added to Selector for consistency; it is more useful with SelectorList. See also: *extract() and extract_first()*

SelectorList objects

class scrapy.selector.**SelectorList**(*iterable=()*, */*)

The *SelectorList* class is a subclass of the builtin `list` class, which provides a few additional methods.

xpath(*xpath: str*, *namespaces: Mapping[str, str] | None = None*, ***kwargs: Any*) → SelectorList[_SelectorType]

Call the `.xpath()` method for each element in this list and return their results flattened as another *SelectorList*.

`xpath` is the same argument as the one in `Selector.xpath()`

`namespaces` is an optional `prefix: namespace-uri` mapping (dict) for additional prefixes to those registered with `register_namespace(prefix, uri)`. Contrary to `register_namespace()`, these prefixes are not saved for future calls.

Any additional named arguments can be used to pass values for XPath variables in the XPath expression, e.g.:

```
selector.xpath('//a[href=$url]', url="http://www.example.com")
```

css(*query: str*) → SelectorList[_SelectorType]

Call the `.css()` method for each element in this list and return their results flattened as another *SelectorList*.

`query` is the same argument as the one in `Selector.css()`

jmespath(*query: str*, ***kwargs: Any*) → SelectorList[_SelectorType]

Call the `.jmespath()` method for each element in this list and return their results flattened as another *SelectorList*.

`query` is the same argument as the one in `Selector.jmespath()`.

Any additional named arguments are passed to the underlying `jmespath.search` call, e.g.:

```
selector.jmespath('author.name', options=jmespath.Options(dict_cls=collections.
↪OrderedDict))
```

getall() → List[str]

Call the `.get()` method for each element is this list and return their results flattened, as a list of strings.

See also: *extract() and extract_first()*

get(*default: None = None*) → str | None

get(*default: str*) → str

Return the result of `.get()` for the first element in this list. If the list is empty, return the default value.

See also: *extract() and extract_first()*

re(*regex: str | Pattern[str]*, *replace_entities: bool = True*) → List[str]

Call the `.re()` method for each element in this list and return their results flattened, as a list of strings.

By default, character entity references are replaced by their corresponding character (except for `&` and `<`. Passing `replace_entities` as `False` switches off these replacements.

re_first(*regex: str | Pattern[str]*, *default: None = None*, *replace_entities: bool = True*) → str | None

re_first(*regex: str | Pattern[str]*, *default: str*, *replace_entities: bool = True*) → str

Call the `.re()` method for the first element in this list and return the result in an string. If the list is empty or the regex doesn't match anything, return the default value (`None` if the argument is not provided).

By default, character entity references are replaced by their corresponding character (except for `&` and `<`. Passing `replace_entities` as `False` switches off these replacements.

attrib

Return the attributes dictionary for the first element. If the list is empty, return an empty dict.

See also: *Selecting element attributes*.

3.3.4 Examples

Selector examples on HTML response

Here are some *Selector* examples to illustrate several concepts. In all cases, we assume there is already a *Selector* instantiated with a *HtmlResponse* object like this:

```
sel = Selector(html_response)
```

1. Select all <h1> elements from an HTML response body, returning a list of *Selector* objects (i.e. a *SelectorList* object):

   ```
   sel.xpath("//h1")
   ```

2. Extract the text of all <h1> elements from an HTML response body, returning a list of strings:

   ```
   sel.xpath("//h1").getall()  # this includes the h1 tag
   sel.xpath("//h1/text()").getall()  # this excludes the h1 tag
   ```

3. Iterate over all <p> tags and print their class attribute:

   ```
   for node in sel.xpath("//p"):
       print(node.attrib["class"])
   ```

Selector examples on XML response

Here are some examples to illustrate concepts for *Selector* objects instantiated with an *XmlResponse* object:

```
sel = Selector(xml_response)
```

1. Select all <product> elements from an XML response body, returning a list of *Selector* objects (i.e. a *SelectorList* object):

```
sel.xpath("//product")
```

2. Extract all prices from a Google Base XML feed which requires registering a namespace:

```
sel.register_namespace("g", "http://base.google.com/ns/1.0")
sel.xpath("//g:price").getall()
```

3.4 Items

The main goal in scraping is to extract structured data from unstructured sources, typically, web pages. *Spiders* may return the extracted data as *items*, Python objects that define key-value pairs.

Scrapy supports *multiple types of items*. When you create an item, you may use whichever type of item you want. When you write code that receives an item, your code should *work for any item type*.

3.4.1 Item Types

Scrapy supports the following types of items, via the itemadapter library: *dictionaries*, *Item objects*, *dataclass objects*, and *attrs objects*.

Dictionaries

As an item type, `dict` is convenient and familiar.

Item objects

`Item` provides a `dict`-like API plus additional features that make it the most feature-complete item type:

class scrapy.**Item**(**args: Any*, ***kwargs: Any*)

Base class for scraped items.

In Scrapy, an object is considered an `item` if it's supported by the itemadapter library. For example, when the output of a spider callback is evaluated, only such objects are passed to *item pipelines*. `Item` is one of the classes supported by itemadapter by default.

Items must declare `Field` attributes, which are processed and stored in the `fields` attribute. This restricts the set of allowed field names and prevents typos, raising `KeyError` when referring to undefined fields. Additionally, fields can be used to define metadata and control the way data is processed internally. Please refer to the *documentation about fields* for additional information.

Unlike instances of `dict`, instances of `Item` may be *tracked* to debug memory leaks.

copy() → Self

deepcopy() → Self

Return a `deepcopy()` of this item.

fields: `dict[str, Field] = {}`

A dictionary containing *all declared fields* for this Item, not only those populated. The keys are the field names and the values are the `Field` objects used in the *Item declaration*.

`Item` objects replicate the standard `dict` API, including its `__init__` method.

`Item` allows the defining of field names, so that:

- `KeyError` is raised when using undefined field names (i.e. prevents typos going unnoticed)
- *Item exporters* can export all fields by default even if the first scraped object does not have values for all of them

Item also allows the defining of field metadata, which can be used to *customize serialization*.

`trackref` tracks *Item* objects to help find memory leaks (see *Debugging memory leaks with trackref*).

Example:

```
from scrapy.item import Item, Field

class CustomItem(Item):
    one_field = Field()
    another_field = Field()
```

Dataclass objects

Added in version 2.2.

`dataclass()` allows the defining of item classes with field names, so that *item exporters* can export all fields by default even if the first scraped object does not have values for all of them.

Additionally, `dataclass` items also allow you to:

- define the type and default value of each defined field.
- define custom field metadata through `dataclasses.field()`, which can be used to *customize serialization*.

Example:

```
from dataclasses import dataclass

@dataclass
class CustomItem:
    one_field: str
    another_field: int
```

Note

Field types are not enforced at run time.

attr.s objects

Added in version 2.2.

`attr.s()` allows the defining of item classes with field names, so that *item exporters* can export all fields by default even if the first scraped object does not have values for all of them.

Additionally, `attr.s` items also allow to:

- define the type and default value of each defined field.
- define custom field metadata, which can be used to *customize serialization*.

In order to use this type, the attrs package needs to be installed.

Example:

```
import attr

@attr.s
class CustomItem:
    one_field = attr.ib()
    another_field = attr.ib()
```

3.4.2 Working with Item objects

Declaring Item subclasses

Item subclasses are declared using a simple class definition syntax and *Field* objects. Here is an example:

```
import scrapy

class Product(scrapy.Item):
    name = scrapy.Field()
    price = scrapy.Field()
    stock = scrapy.Field()
    tags = scrapy.Field()
    last_updated = scrapy.Field(serializer=str)
```

Note

Those familiar with Django will notice that Scrapy Items are declared similar to Django Models, except that Scrapy Items are much simpler as there is no concept of different field types.

Declaring fields

Field objects are used to specify metadata for each field. For example, the serializer function for the `last_updated` field illustrated in the example above.

You can specify any kind of metadata for each field. There is no restriction on the values accepted by *Field* objects. For this same reason, there is no reference list of all available metadata keys. Each key defined in *Field* objects could be used by a different component, and only those components know about it. You can also define and use any other *Field* key in your project too, for your own needs. The main goal of *Field* objects is to provide a way to define all field metadata in one place. Typically, those components whose behaviour depends on each field use certain field keys to configure that behaviour. You must refer to their documentation to see which metadata keys are used by each component.

It's important to note that the *Field* objects used to declare the item do not stay assigned as class attributes. Instead, they can be accessed through the *fields* attribute.

class scrapy.**Field**

Container of field metadata

The *Field* class is just an alias to the built-in `dict` class and doesn't provide any extra functionality or attributes. In other words, *Field* objects are plain-old Python dicts. A separate class is used to support the *item declaration syntax* based on class attributes.

> **Note**
>
> Field metadata can also be declared for `dataclass` and `attrs` items. Please refer to the documentation for dataclasses.field and attr.ib for additional information.

Working with Item objects

Here are some examples of common tasks performed with items, using the `Product` item *declared above*. You will notice the API is very similar to the `dict` API.

Creating items

```
>>> product = Product(name="Desktop PC", price=1000)
>>> print(product)
Product(name='Desktop PC', price=1000)
```

Getting field values

```
>>> product["name"]
Desktop PC
>>> product.get("name")
Desktop PC

>>> product["price"]
1000

>>> product["last_updated"]
Traceback (most recent call last):
    ...
KeyError: 'last_updated'

>>> product.get("last_updated", "not set")
not set

>>> product["lala"]  # getting unknown field
Traceback (most recent call last):
    ...
KeyError: 'lala'

>>> product.get("lala", "unknown field")
'unknown field'

>>> "name" in product  # is name field populated?
True

>>> "last_updated" in product  # is last_updated populated?
False

>>> "last_updated" in product.fields  # is last_updated a declared field?
True
```

(continues on next page)

(continued from previous page)

```
>>> "lala" in product.fields  # is lala a declared field?
False
```

Setting field values

```
>>> product["last_updated"] = "today"
>>> product["last_updated"]
today

>>> product["lala"] = "test"  # setting unknown field
Traceback (most recent call last):
    ...
KeyError: 'Product does not support field: lala'
```

Accessing all populated values

To access all populated values, just use the typical `dict` API:

```
>>> product.keys()
['price', 'name']

>>> product.items()
[('price', 1000), ('name', 'Desktop PC')]
```

Copying items

To copy an item, you must first decide whether you want a shallow copy or a deep copy.

If your item contains mutable values like lists or dictionaries, a shallow copy will keep references to the same mutable values across all different copies.

For example, if you have an item with a list of tags, and you create a shallow copy of that item, both the original item and the copy have the same list of tags. Adding a tag to the list of one of the items will add the tag to the other item as well.

If that is not the desired behavior, use a deep copy instead.

See `copy` for more information.

To create a shallow copy of an item, you can either call *copy()* on an existing item (`product2 = product.copy()`) or instantiate your item class from an existing item (`product2 = Product(product)`).

To create a deep copy, call *deepcopy()* instead (`product2 = product.deepcopy()`).

Other common tasks

Creating dicts from items:

```
>>> dict(product)  # create a dict from all populated values
{'price': 1000, 'name': 'Desktop PC'}

Creating items from dicts:

>>> Product({"name": "Laptop PC", "price": 1500})
```

(continues on next page)

(continued from previous page)

```
Product(price=1500, name='Laptop PC')

>>> Product({"name": "Laptop PC", "lala": 1500})  # warning: unknown field in dict
Traceback (most recent call last):
    ...
KeyError: 'Product does not support field: lala'
```

Extending Item subclasses

You can extend Items (to add more fields or to change some metadata for some fields) by declaring a subclass of your original Item.

For example:

```
class DiscountedProduct(Product):
    discount_percent = scrapy.Field(serializer=str)
    discount_expiration_date = scrapy.Field()
```

You can also extend field metadata by using the previous field metadata and appending more values, or changing existing values, like this:

```
class SpecificProduct(Product):
    name = scrapy.Field(Product.fields["name"], serializer=my_serializer)
```

That adds (or replaces) the `serializer` metadata key for the `name` field, keeping all the previously existing metadata values.

3.4.3 Supporting All Item Types

In code that receives an item, such as methods of *item pipelines* or *spider middlewares*, it is a good practice to use the `ItemAdapter` class to write code that works for any supported item type.

3.4.4 Other classes related to items

class scrapy.item.**ItemMeta**(*class_name: str*, *bases: tuple[type, ...]*, *attrs: dict[str, Any]*)

Metaclass of *Item* that handles field definitions.

3.5 Item Loaders

Item Loaders provide a convenient mechanism for populating scraped *items*. Even though items can be populated directly, Item Loaders provide a much more convenient API for populating them from a scraping process, by automating some common tasks like parsing the raw extracted data before assigning it.

In other words, *items* provide the *container* of scraped data, while Item Loaders provide the mechanism for *populating* that container.

Item Loaders are designed to provide a flexible, efficient and easy mechanism for extending and overriding different field parsing rules, either by spider, or by source format (HTML, XML, etc) without becoming a nightmare to maintain.

> **Note**
>
> Item Loaders are an extension of the itemloaders library that make it easier to work with Scrapy by adding support for *responses*.

3.5.1 Using Item Loaders to populate items

To use an Item Loader, you must first instantiate it. You can either instantiate it with an *item object* or without one, in which case an *item object* is automatically created in the Item Loader `__init__` method using the *item* class specified in the `ItemLoader.default_item_class` attribute.

Then, you start collecting values into the Item Loader, typically using *Selectors*. You can add more than one value to the same item field; the Item Loader will know how to "join" those values later using a proper processing function.

> **Note**
>
> Collected data is internally stored as lists, allowing to add several values to the same field. If an `item` argument is passed when creating a loader, each of the item's values will be stored as-is if it's already an iterable, or wrapped with a list if it's a single value.

Here is a typical Item Loader usage in a *Spider*, using the *Product item* declared in the *Items chapter*:

```
from scrapy.loader import ItemLoader
from myproject.items import Product

def parse(self, response):
    l = ItemLoader(item=Product(), response=response)
    l.add_xpath("name", '//div[@class="product_name"]')
    l.add_xpath("name", '//div[@class="product_title"]')
    l.add_xpath("price", '//p[@id="price"]')
    l.add_css("stock", "p#stock")
    l.add_value("last_updated", "today")  # you can also use literal values
    return l.load_item()
```

By quickly looking at that code, we can see the `name` field is being extracted from two different XPath locations in the page:

1. `//div[@class="product_name"]`
2. `//div[@class="product_title"]`

In other words, data is being collected by extracting it from two XPath locations, using the `add_xpath()` method. This is the data that will be assigned to the `name` field later.

Afterwards, similar calls are used for `price` and `stock` fields (the latter using a CSS selector with the `add_css()` method), and finally the `last_update` field is populated directly with a literal value (`today`) using a different method: `add_value()`.

Finally, when all data is collected, the `ItemLoader.load_item()` method is called which actually returns the item populated with the data previously extracted and collected with the `add_xpath()`, `add_css()`, and `add_value()` calls.

3.5.2 Working with dataclass items

By default, *dataclass items* require all fields to be passed when created. This could be an issue when using dataclass items with item loaders: unless a pre-populated item is passed to the loader, fields will be populated incrementally using the loader's `add_xpath()`, `add_css()` and `add_value()` methods.

One approach to overcome this is to define items using the `field()` function, with a `default` argument:

```
from dataclasses import dataclass, field
from typing import Optional

@dataclass
class InventoryItem:
    name: Optional[str] = field(default=None)
    price: Optional[float] = field(default=None)
    stock: Optional[int] = field(default=None)
```

3.5.3 Input and Output processors

An Item Loader contains one input processor and one output processor for each (item) field. The input processor processes the extracted data as soon as it's received (through the *add_xpath()*, *add_css()* or *add_value()* methods) and the result of the input processor is collected and kept inside the ItemLoader. After collecting all data, the *ItemLoader.load_item()* method is called to populate and get the populated *item object*. That's when the output processor is called with the data previously collected (and processed using the input processor). The result of the output processor is the final value that gets assigned to the item.

Let's see an example to illustrate how the input and output processors are called for a particular field (the same applies for any other field):

```
l = ItemLoader(Product(), some_selector)
l.add_xpath("name", xpath1)  # (1)
l.add_xpath("name", xpath2)  # (2)
l.add_css("name", css)  # (3)
l.add_value("name", "test")  # (4)
return l.load_item()  # (5)
```

So what happens is:

1. Data from `xpath1` is extracted, and passed through the *input processor* of the `name` field. The result of the input processor is collected and kept in the Item Loader (but not yet assigned to the item).
2. Data from `xpath2` is extracted, and passed through the same *input processor* used in (1). The result of the input processor is appended to the data collected in (1) (if any).
3. This case is similar to the previous ones, except that the data is extracted from the `css` CSS selector, and passed through the same *input processor* used in (1) and (2). The result of the input processor is appended to the data collected in (1) and (2) (if any).
4. This case is also similar to the previous ones, except that the value to be collected is assigned directly, instead of being extracted from a XPath expression or a CSS selector. However, the value is still passed through the input processors. In this case, since the value is not iterable it is converted to an iterable of a single element before passing it to the input processor, because input processor always receive iterables.
5. The data collected in steps (1), (2), (3) and (4) is passed through the *output processor* of the `name` field. The result of the output processor is the value assigned to the `name` field in the item.

It's worth noticing that processors are just callable objects, which are called with the data to be parsed, and return a parsed value. So you can use any function as input or output processor. The only requirement is that they must accept one (and only one) positional argument, which will be an iterable.

Changed in version 2.0: Processors no longer need to be methods.

> **Note**
>
> Both input and output processors must receive an iterable as their first argument. The output of those functions can be anything. The result of input processors will be appended to an internal list (in the Loader) containing the collected values (for that field). The result of the output processors is the value that will be finally assigned to the item.

The other thing you need to keep in mind is that the values returned by input processors are collected internally (in lists) and then passed to output processors to populate the fields.

Last, but not least, itemloaders comes with some commonly used processors built-in for convenience.

3.5.4 Declaring Item Loaders

Item Loaders are declared using a class definition syntax. Here is an example:

```
from itemloaders.processors import TakeFirst, MapCompose, Join
from scrapy.loader import ItemLoader

class ProductLoader(ItemLoader):
    default_output_processor = TakeFirst()

    name_in = MapCompose(str.title)
    name_out = Join()

    price_in = MapCompose(str.strip)

    # ...
```

As you can see, input processors are declared using the `_in` suffix while output processors are declared using the `_out` suffix. And you can also declare a default input/output processors using the *ItemLoader.default_input_processor* and *ItemLoader.default_output_processor* attributes.

3.5.5 Declaring Input and Output Processors

As seen in the previous section, input and output processors can be declared in the Item Loader definition, and it's very common to declare input processors this way. However, there is one more place where you can specify the input and output processors to use: in the *Item Field* metadata. Here is an example:

```
import scrapy
from itemloaders.processors import Join, MapCompose, TakeFirst
from w3lib.html import remove_tags

def filter_price(value):
    if value.isdigit():
        return value

class Product(scrapy.Item):
    name = scrapy.Field(
        input_processor=MapCompose(remove_tags),
        output_processor=Join(),
```

(continues on next page)

(continued from previous page)

```
    )
    price = scrapy.Field(
        input_processor=MapCompose(remove_tags, filter_price),
        output_processor=TakeFirst(),
    )
```

```
>>> from scrapy.loader import ItemLoader
>>> il = ItemLoader(item=Product())
>>> il.add_value("name", ["Welcome to my", "<strong>website</strong>"])
>>> il.add_value("price", ["&euro;", "<span>1000</span>"])
>>> il.load_item()
{'name': 'Welcome to my website', 'price': '1000'}
```

The precedence order, for both input and output processors, is as follows:

1. Item Loader field-specific attributes: `field_in` and `field_out` (most precedence)
2. Field metadata (`input_processor` and `output_processor` key)
3. Item Loader defaults: *ItemLoader.default_input_processor()* and *ItemLoader.default_output_processor()* (least precedence)

See also: *Reusing and extending Item Loaders*.

3.5.6 Item Loader Context

The Item Loader Context is a dict of arbitrary key/values which is shared among all input and output processors in the Item Loader. It can be passed when declaring, instantiating or using Item Loader. They are used to modify the behaviour of the input/output processors.

For example, suppose you have a function `parse_length` which receives a text value and extracts a length from it:

```
def parse_length(text, loader_context):
    unit = loader_context.get("unit", "m")
    # ... length parsing code goes here ...
    return parsed_length
```

By accepting a `loader_context` argument the function is explicitly telling the Item Loader that it's able to receive an Item Loader context, so the Item Loader passes the currently active context when calling it, and the processor function (`parse_length` in this case) can thus use them.

There are several ways to modify Item Loader context values:

1. By modifying the currently active Item Loader context (*context* attribute):

   ```
   loader = ItemLoader(product)
   loader.context["unit"] = "cm"
   ```

2. On Item Loader instantiation (the keyword arguments of Item Loader `__init__` method are stored in the Item Loader context):

   ```
   loader = ItemLoader(product, unit="cm")
   ```

3. On Item Loader declaration, for those input/output processors that support instantiating them with an Item Loader context. `MapCompose` is one of them:

```
class ProductLoader(ItemLoader):
    length_out = MapCompose(parse_length, unit="cm")
```

3.5.7 ItemLoader objects

class scrapy.loader.**ItemLoader**(*item: Any = None*, *selector:* Selector | *None = None*, *response:* TextResponse | *None = None*, *parent: itemloaders.ItemLoader | None = None*, ***context: Any*)

A user-friendly abstraction to populate an *item* with data by applying *field processors* to scraped data. When instantiated with a `selector` or a `response` it supports data extraction from web pages using *selectors*.

Parameters

- **item** (scrapy.item.Item) – The item instance to populate using subsequent calls to *add_xpath()*, *add_css()*, or *add_value()*.
- **selector** (*Selector* object) – The selector to extract data from, when using the *add_xpath()*, *add_css()*, *replace_xpath()*, or *replace_css()* method.
- **response** (*Response* object) – The response used to construct the selector using the *default_selector_class*, unless the selector argument is given, in which case this argument is ignored.

If no item is given, one is instantiated automatically using the class in *default_item_class*.

The item, selector, response and remaining keyword arguments are assigned to the Loader context (accessible through the *context* attribute).

item

The item object being parsed by this Item Loader. This is mostly used as a property so, when attempting to override this value, you may want to check out *default_item_class* first.

context

The currently active Context of this Item Loader.

default_item_class

An *item* class (or factory), used to instantiate items when not given in the `__init__` method.

default_input_processor

The default input processor to use for those fields which don't specify one.

default_output_processor

The default output processor to use for those fields which don't specify one.

default_selector_class

The class used to construct the *selector* of this *ItemLoader*, if only a response is given in the `__init__` method. If a selector is given in the `__init__` method this attribute is ignored. This attribute is sometimes overridden in subclasses.

selector

The *Selector* object to extract data from. It's either the selector given in the `__init__` method or one created from the response given in the `__init__` method using the *default_selector_class*. This attribute is meant to be read-only.

add_css(*field_name: str | None*, *css: str | Iterable[str]*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to *ItemLoader.add_value()* but receives a CSS selector instead of a value, which is used to extract a list of unicode strings from the selector associated with this *ItemLoader*.

See *get_css()* for kwargs.

Parameters
css (*str*) – the CSS selector to extract data from

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

Examples:

```
# HTML snippet: <p class="product-name">Color TV</p>
loader.add_css('name', 'p.product-name')
# HTML snippet: <p id="price">the price is $1200</p>
loader.add_css('price', 'p#price', re='the price is (.*)')
```

add_jmes(*field_name: str | None*, *jmes: str*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to *ItemLoader.add_value()* but receives a JMESPath selector instead of a value, which is used to extract a list of unicode strings from the selector associated with this *ItemLoader*.

See *get_jmes()* for kwargs.

Parameters
jmes (*str*) – the JMESPath selector to extract data from

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

Examples:

```
# HTML snippet: {"name": "Color TV"}
loader.add_jmes('name')
# HTML snippet: {"price": the price is $1200"}
loader.add_jmes('price', TakeFirst(), re='the price is (.*)')
```

add_value(*field_name: str | None*, *value: Any*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Process and then add the given value for the given field.

The value is first passed through *get_value()* by giving the processors and kwargs, and then passed through the field input processor and its result appended to the data collected for that field. If the field already contains collected data, the new data is added.

The given field_name can be None, in which case values for multiple fields may be added. And the processed value should be a dict with field_name mapped to values.

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

Examples:

```
loader.add_value('name', 'Color TV')
loader.add_value('colours', ['white', 'blue'])
loader.add_value('length', '100')
loader.add_value('name', 'name: foo', TakeFirst(), re='name: (.+)')
loader.add_value(None, {'name': 'foo', 'sex': 'male'})
```

add_xpath(*field_name: str | None*, *xpath: str | Iterable[str]*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to *ItemLoader.add_value()* but receives an XPath instead of a value, which is used to extract a list of strings from the selector associated with this *ItemLoader*.

See *get_xpath()* for `kwargs`.

Parameters
xpath (*str*) – the XPath to extract data from

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

Examples:

```
# HTML snippet: <p class="product-name">Color TV</p>
loader.add_xpath('name', '//p[@class="product-name"]')
# HTML snippet: <p id="price">the price is $1200</p>
loader.add_xpath('price', '//p[@id="price"]', re='the price is (.*)')
```

get_collected_values(*field_name: str*) → List[Any]

Return the collected values for the given field.

get_css(*css: str | Iterable[str]*, **processors: Callable[[...], Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Any

Similar to *ItemLoader.get_value()* but receives a CSS selector instead of a value, which is used to extract a list of unicode strings from the selector associated with this *ItemLoader*.

Parameters

- **css** (*str*) – the CSS selector to extract data from
- **re** (*str or Pattern[str]*) – a regular expression to use for extracting data from the selected CSS region

Examples:

```
# HTML snippet: <p class="product-name">Color TV</p>
loader.get_css('p.product-name')
# HTML snippet: <p id="price">the price is $1200</p>
loader.get_css('p#price', TakeFirst(), re='the price is (.*)')
```

get_jmes(*jmes: str | Iterable[str]*, **processors: Callable[[...], Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Any

Similar to *ItemLoader.get_value()* but receives a JMESPath selector instead of a value, which is used to extract a list of unicode strings from the selector associated with this *ItemLoader*.

Parameters

- **jmes** (*str*) – the JMESPath selector to extract data from

- **re** (*str or Pattern*) – a regular expression to use for extracting data from the selected JMESPath

Examples:

```
# HTML snippet: {"name": "Color TV"}
loader.get_jmes('name')
# HTML snippet: {"price": the price is $1200"}
loader.get_jmes('price', TakeFirst(), re='the price is (.*)')
```

get_output_value(*field_name: str*) → Any

Return the collected values parsed using the output processor, for the given field. This method doesn't populate or modify the item at all.

get_value(*value: Any*, **processors: Callable[[...], Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Any

Process the given `value` by the given `processors` and keyword arguments.

Available keyword arguments:

Parameters

re (*str or Pattern[str]*) – a regular expression to use for extracting data from the given value using `extract_regex()` method, applied before processors

Examples:

```
>>> from itemloaders import ItemLoader
>>> from itemloaders.processors import TakeFirst
>>> loader = ItemLoader()
>>> loader.get_value('name: foo', TakeFirst(), str.upper, re='name: (.+)')
'FOO'
```

get_xpath(*xpath: str | Iterable[str]*, **processors: Callable[[...], Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Any

Similar to *ItemLoader.get_value()* but receives an XPath instead of a value, which is used to extract a list of unicode strings from the selector associated with this *ItemLoader*.

Parameters

- **xpath** (*str*) – the XPath to extract data from
- **re** (*str or Pattern[str]*) – a regular expression to use for extracting data from the selected XPath region

Examples:

```
# HTML snippet: <p class="product-name">Color TV</p>
loader.get_xpath('//p[@class="product-name"]')
# HTML snippet: <p id="price">the price is $1200</p>
loader.get_xpath('//p[@id="price"]', TakeFirst(), re='the price is (.*)')
```

load_item() → Any

Populate the item with the data collected so far, and return it. The data collected is first passed through the output processors to get the final value to assign to each item field.

nested_css(*css: str*, ***context: Any*) → Self

Create a nested loader with a css selector. The supplied selector is applied relative to selector associated with this *ItemLoader*. The nested loader shares the item with the parent *ItemLoader* so calls to *add_xpath()*, *add_value()*, *replace_value()*, etc. will behave as expected.

nested_xpath(*xpath: str*, ***context: Any*) → Self

Create a nested loader with an xpath selector. The supplied selector is applied relative to selector associated with this `ItemLoader`. The nested loader shares the item with the parent `ItemLoader` so calls to `add_xpath()`, `add_value()`, `replace_value()`, etc. will behave as expected.

replace_css(*field_name: str | None*, *css: str | Iterable[str]*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to `add_css()` but replaces collected data instead of adding it.

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

replace_jmes(*field_name: str | None*, *jmes: str | Iterable[str]*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to `add_jmes()` but replaces collected data instead of adding it.

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

replace_value(*field_name: str | None*, *value: Any*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to `add_value()` but replaces the collected data with the new value instead of adding it.

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

replace_xpath(*field_name: str | None*, *xpath: str | Iterable[str]*, **processors: Callable[..., Any]*, *re: str | Pattern[str] | None = None*, ***kw: Any*) → Self

Similar to `add_xpath()` but replaces collected data instead of adding it.

Returns
The current ItemLoader instance for method chaining.

Return type
ItemLoader

3.5.8 Nested Loaders

When parsing related values from a subsection of a document, it can be useful to create nested loaders. Imagine you're extracting details from a footer of a page that looks something like:

Example:

```
<footer>
    <a class="social" href="https://facebook.com/whatever">Like Us</a>
    <a class="social" href="https://twitter.com/whatever">Follow Us</a>
    <a class="email" href="mailto:whatever@example.com">Email Us</a>
</footer>
```

Without nested loaders, you need to specify the full xpath (or css) for each value that you wish to extract.

Example:

```
loader = ItemLoader(item=Item())
# load stuff not in the footer
loader.add_xpath("social", '//footer/a[@class = "social"]/@href')
loader.add_xpath("email", '//footer/a[@class = "email"]/@href')
loader.load_item()
```

Instead, you can create a nested loader with the footer selector and add values relative to the footer. The functionality is the same but you avoid repeating the footer selector.

Example:

```
loader = ItemLoader(item=Item())
# load stuff not in the footer
footer_loader = loader.nested_xpath("//footer")
footer_loader.add_xpath("social", 'a[@class = "social"]/@href')
footer_loader.add_xpath("email", 'a[@class = "email"]/@href')
# no need to call footer_loader.load_item()
loader.load_item()
```

You can nest loaders arbitrarily and they work with either xpath or css selectors. As a general guideline, use nested loaders when they make your code simpler but do not go overboard with nesting or your parser can become difficult to read.

3.5.9 Reusing and extending Item Loaders

As your project grows bigger and acquires more and more spiders, maintenance becomes a fundamental problem, especially when you have to deal with many different parsing rules for each spider, having a lot of exceptions, but also wanting to reuse the common processors.

Item Loaders are designed to ease the maintenance burden of parsing rules, without losing flexibility and, at the same time, providing a convenient mechanism for extending and overriding them. For this reason Item Loaders support traditional Python class inheritance for dealing with differences of specific spiders (or groups of spiders).

Suppose, for example, that some particular site encloses their product names in three dashes (e.g. `---Plasma TV---`) and you don't want to end up scraping those dashes in the final product names.

Here's how you can remove those dashes by reusing and extending the default Product Item Loader (`ProductLoader`):

```
from itemloaders.processors import MapCompose
from myproject.ItemLoaders import ProductLoader

def strip_dashes(x):
    return x.strip("-")

class SiteSpecificLoader(ProductLoader):
    name_in = MapCompose(strip_dashes, ProductLoader.name_in)
```

Another case where extending Item Loaders can be very helpful is when you have multiple source formats, for example XML and HTML. In the XML version you may want to remove `CDATA` occurrences. Here's an example of how to do it:

```
from itemloaders.processors import MapCompose
from myproject.ItemLoaders import ProductLoader
from myproject.utils.xml import remove_cdata

class XmlProductLoader(ProductLoader):
    name_in = MapCompose(remove_cdata, ProductLoader.name_in)
```

And that's how you typically extend input processors.

As for output processors, it is more common to declare them in the field metadata, as they usually depend only on the field and not on each specific site parsing rule (as input processors do). See also: *Declaring Input and Output Processors*.

There are many other possible ways to extend, inherit and override your Item Loaders, and different Item Loaders hierarchies may fit better for different projects. Scrapy only provides the mechanism; it doesn't impose any specific organization of your Loaders collection - that's up to you and your project's needs.

3.6 Scrapy shell

The Scrapy shell is an interactive shell where you can try and debug your scraping code very quickly, without having to run the spider. It's meant to be used for testing data extraction code, but you can actually use it for testing any kind of code as it is also a regular Python shell.

The shell is used for testing XPath or CSS expressions and see how they work and what data they extract from the web pages you're trying to scrape. It allows you to interactively test your expressions while you're writing your spider, without having to run the spider to test every change.

Once you get familiarized with the Scrapy shell, you'll see that it's an invaluable tool for developing and debugging your spiders.

3.6.1 Configuring the shell

If you have IPython installed, the Scrapy shell will use it (instead of the standard Python console). The IPython console is much more powerful and provides smart auto-completion and colorized output, among other things.

We highly recommend you install IPython, specially if you're working on Unix systems (where IPython excels). See the IPython installation guide for more info.

Scrapy also has support for bpython, and will try to use it where IPython is unavailable.

Through Scrapy's settings you can configure it to use any one of `ipython`, `bpython` or the standard `python` shell, regardless of which are installed. This is done by setting the `SCRAPY_PYTHON_SHELL` environment variable; or by defining it in your *scrapy.cfg*:

```
[settings]
shell = bpython
```

3.6.2 Launch the shell

To launch the Scrapy shell you can use the `shell` command like this:

```
scrapy shell <url>
```

Where the <url> is the URL you want to scrape.

shell also works for local files. This can be handy if you want to play around with a local copy of a web page. *shell* understands the following syntaxes for local files:

```
# UNIX-style
scrapy shell ./path/to/file.html
scrapy shell ../other/path/to/file.html
scrapy shell /absolute/path/to/file.html

# File URI
scrapy shell file:///absolute/path/to/file.html
```

Note

When using relative file paths, be explicit and prepend them with `./` (or `../` when relevant). `scrapy shell index.html` will not work as one might expect (and this is by design, not a bug).

Because *shell* favors HTTP URLs over File URIs, and `index.html` being syntactically similar to `example.com`, *shell* will treat `index.html` as a domain name and trigger a DNS lookup error:

```
$ scrapy shell index.html
[ ... scrapy shell starts ... ]
[ ... traceback ... ]
twisted.internet.error.DNSLookupError: DNS lookup failed:
address 'index.html' not found: [Errno -5] No address associated with hostname.
```

shell will not test beforehand if a file called `index.html` exists in the current directory. Again, be explicit.

3.6.3 Using the shell

The Scrapy shell is just a regular Python console (or IPython console if you have it available) which provides some additional shortcut functions for convenience.

Available Shortcuts

- `shelp()` - print a help with the list of available objects and shortcuts
- `fetch(url[, redirect=True])` - fetch a new response from the given URL and update all related objects accordingly. You can optionally ask for HTTP 3xx redirections to not be followed by passing `redirect=False`
- `fetch(request)` - fetch a new response from the given request and update all related objects accordingly.
- `view(response)` - open the given response in your local web browser, for inspection. This will add a <base> tag to the response body in order for external links (such as images and style sheets) to display properly. Note, however, that this will create a temporary file in your computer, which won't be removed automatically.

Available Scrapy objects

The Scrapy shell automatically creates some convenient objects from the downloaded page, like the *Response* object and the *Selector* objects (for both HTML and XML content).

Those objects are:

- `crawler` - the current *Crawler* object.
- `spider` - the Spider which is known to handle the URL, or a *Spider* object if there is no spider found for the current URL

- `request` - a *`Request`* object of the last fetched page. You can modify this request using *`replace()`* or fetch a new request (without leaving the shell) using the `fetch` shortcut.
- `response` - a *`Response`* object containing the last fetched page
- `settings` - the current *Scrapy settings*

3.6.4 Example of shell session

Here's an example of a typical shell session where we start by scraping the https://scrapy.org page, and then proceed to scrape the https://old.reddit.com/ page. Finally, we modify the (Reddit) request method to POST and re-fetch it getting an error. We end the session by typing Ctrl-D (in Unix systems) or Ctrl-Z in Windows.

Keep in mind that the data extracted here may not be the same when you try it, as those pages are not static and could have changed by the time you test this. The only purpose of this example is to get you familiarized with how the Scrapy shell works.

First, we launch the shell:

```
scrapy shell 'https://scrapy.org' --nolog
```

Note

Remember to always enclose URLs in quotes when running the Scrapy shell from the command line, otherwise URLs containing arguments (i.e. the & character) will not work.

On Windows, use double quotes instead:

```
scrapy shell "https://scrapy.org" --nolog
```

Then, the shell fetches the URL (using the Scrapy downloader) and prints the list of available objects and useful shortcuts (you'll notice that these lines all start with the `[s]` prefix):

```
[s] Available Scrapy objects:
[s]   scrapy     scrapy module (contains scrapy.Request, scrapy.Selector, etc)
[s]   crawler    <scrapy.crawler.Crawler object at 0x7f07395dd690>
[s]   item       {}
[s]   request    <GET https://scrapy.org>
[s]   response   <200 https://scrapy.org/>
[s]   settings   <scrapy.settings.Settings object at 0x7f07395dd710>
[s]   spider     <DefaultSpider 'default' at 0x7f0735891690>
[s] Useful shortcuts:
[s]   fetch(url[, redirect=True]) Fetch URL and update local objects (by default,␣
↪redirects are followed)
[s]   fetch(req)                  Fetch a scrapy.Request and update local objects
[s]   shelp()           Shell help (print this help)
[s]   view(response)    View response in a browser

>>>
```

After that, we can start playing with the objects:

```
>>> response.xpath("//title/text()").get()
'Scrapy | A Fast and Powerful Scraping and Web Crawling Framework'
```

(continues on next page)

(continued from previous page)

```
>>> fetch("https://old.reddit.com/")

>>> response.xpath("//title/text()").get()
'reddit: the front page of the internet'

>>> request = request.replace(method="POST")

>>> fetch(request)

>>> response.status
404

>>> from pprint import pprint

>>> pprint(response.headers)
{'Accept-Ranges': ['bytes'],
'Cache-Control': ['max-age=0, must-revalidate'],
'Content-Type': ['text/html; charset=UTF-8'],

```

3.6.5 Invoking the shell from spiders to inspect responses

Sometimes you want to inspect the responses that are being processed in a certain point of your spider, if only to check that response you expect is getting there.

This can be achieved by using the `scrapy.shell.inspect_response` function.

Here's an example of how you would call it from your spider:

```
import scrapy

class MySpider(scrapy.Spider):
```

(continues on next page)

(continued from previous page)

```
    name = "myspider"
    start_urls = [
        "http://example.com",
        "http://example.org",
        "http://example.net",
    ]

    def parse(self, response):
        # We want to inspect one specific response.
        if ".org" in response.url:
            from scrapy.shell import inspect_response

            inspect_response(response, self)

        # Rest of parsing code.
```

When you run the spider, you will get something similar to this:

```
2014-01-23 17:48:31-0400 [scrapy.core.engine] DEBUG: Crawled (200) <GET http://example.
↪com> (referer: None)
2014-01-23 17:48:31-0400 [scrapy.core.engine] DEBUG: Crawled (200) <GET http://example.
↪org> (referer: None)
[s] Available Scrapy objects:
[s]   crawler    <scrapy.crawler.Crawler object at 0x1e16b50>
...

>>> response.url
'http://example.org'
```

Then, you can check if the extraction code is working:

```
>>> response.xpath('//h1[@class="fn"]')
[]
```

Nope, it doesn't. So you can open the response in your web browser and see if it's the response you were expecting:

```
>>> view(response)
True
```

Finally you hit Ctrl-D (or Ctrl-Z in Windows) to exit the shell and resume the crawling:

```
>>> ^D
2014-01-23 17:50:03-0400 [scrapy.core.engine] DEBUG: Crawled (200) <GET http://example.
↪net> (referer: None)
...
```

Note that you can't use the `fetch` shortcut here since the Scrapy engine is blocked by the shell. However, after you leave the shell, the spider will continue crawling where it stopped, as shown above.

3.7 Item Pipeline

After an item has been scraped by a spider, it is sent to the Item Pipeline which processes it through several components that are executed sequentially.

Each item pipeline component (sometimes referred as just "Item Pipeline") is a Python class that implements a simple method. They receive an item and perform an action over it, also deciding if the item should continue through the pipeline or be dropped and no longer processed.

Typical uses of item pipelines are:

- cleansing HTML data
- validating scraped data (checking that the items contain certain fields)
- checking for duplicates (and dropping them)
- storing the scraped item in a database

3.7.1 Writing your own item pipeline

Each item pipeline is a *component* that must implement the following method:

process_item(*self*, *item*, *spider*)

This method is called for every item pipeline component.

item is an *item object*, see *Supporting All Item Types*.

process_item() must either: return an *item object*, return a `Deferred` or raise a *DropItem* exception.

Dropped items are no longer processed by further pipeline components.

Parameters

- **item** (*item object*) – the scraped item
- **spider** (*Spider* object) – the spider which scraped the item

Additionally, they may also implement the following methods:

open_spider(*self*, *spider*)

This method is called when the spider is opened.

Parameters
spider (*Spider* object) – the spider which was opened

close_spider(*self*, *spider*)

This method is called when the spider is closed.

Parameters
spider (*Spider* object) – the spider which was closed

3.7.2 Item pipeline example

Price validation and dropping items with no prices

Let's take a look at the following hypothetical pipeline that adjusts the `price` attribute for those items that do not include VAT (`price_excludes_vat` attribute), and drops those items which don't contain a price:

```
from itemadapter import ItemAdapter
from scrapy.exceptions import DropItem
```

(continues on next page)

(continued from previous page)

```
class PricePipeline:
    vat_factor = 1.15

    def process_item(self, item, spider):
        adapter = ItemAdapter(item)
        if adapter.get("price"):
            if adapter.get("price_excludes_vat"):
                adapter["price"] = adapter["price"] * self.vat_factor
            return item
        else:
            raise DropItem("Missing price")
```

Write items to a JSON lines file

The following pipeline stores all scraped items (from all spiders) into a single `items.jsonl` file, containing one item per line serialized in JSON format:

```
import json

from itemadapter import ItemAdapter

class JsonWriterPipeline:
    def open_spider(self, spider):
        self.file = open("items.jsonl", "w")

    def close_spider(self, spider):
        self.file.close()

    def process_item(self, item, spider):
        line = json.dumps(ItemAdapter(item).asdict()) + "\n"
        self.file.write(line)
        return item
```

Note

The purpose of JsonWriterPipeline is just to introduce how to write item pipelines. If you really want to store all scraped items into a JSON file you should use the *Feed exports*.

Write items to MongoDB

In this example we'll write items to MongoDB using pymongo. MongoDB address and database name are specified in Scrapy settings; MongoDB collection is named after item class.

The main point of this example is to show how to *get the crawler* and how to clean up the resources properly.

```
import pymongo
from itemadapter import ItemAdapter

```

(continues on next page)

(continued from previous page)

```
class MongoPipeline:
    collection_name = "scrapy_items"

    def __init__(self, mongo_uri, mongo_db):
        self.mongo_uri = mongo_uri
        self.mongo_db = mongo_db

    @classmethod
    def from_crawler(cls, crawler):
        return cls(
            mongo_uri=crawler.settings.get("MONGO_URI"),
            mongo_db=crawler.settings.get("MONGO_DATABASE", "items"),
        )

    def open_spider(self, spider):
        self.client = pymongo.MongoClient(self.mongo_uri)
        self.db = self.client[self.mongo_db]

    def close_spider(self, spider):
        self.client.close()

    def process_item(self, item, spider):
        self.db[self.collection_name].insert_one(ItemAdapter(item).asdict())
        return item
```

Take screenshot of item

This example demonstrates how to use *coroutine syntax* in the *process_item()* method.

This item pipeline makes a request to a locally-running instance of Splash to render a screenshot of the item URL. After the request response is downloaded, the item pipeline saves the screenshot to a file and adds the filename to the item.

```
import hashlib
from pathlib import Path
from urllib.parse import quote

import scrapy
from itemadapter import ItemAdapter
from scrapy.http.request import NO_CALLBACK
from scrapy.utils.defer import maybe_deferred_to_future

class ScreenshotPipeline:
    """Pipeline that uses Splash to render screenshot of
    every Scrapy item."""

    SPLASH_URL = "http://localhost:8050/render.png?url={}"

    async def process_item(self, item, spider):
        adapter = ItemAdapter(item)
        encoded_item_url = quote(adapter["url"])
        screenshot_url = self.SPLASH_URL.format(encoded_item_url)
```

(continues on next page)

(continued from previous page)

```
        request = scrapy.Request(screenshot_url, callback=NO_CALLBACK)
        response = await maybe_deferred_to_future(
            spider.crawler.engine.download(request)
        )

        if response.status != 200:
            # Error happened, return item.
            return item

        # Save screenshot to file, filename will be hash of url.
        url = adapter["url"]
        url_hash = hashlib.md5(url.encode("utf8")).hexdigest()
        filename = f"{url_hash}.png"
        Path(filename).write_bytes(response.body)

        # Store filename in item.
        adapter["screenshot_filename"] = filename
        return item
```

Duplicates filter

A filter that looks for duplicate items, and drops those items that were already processed. Let's say that our items have a unique id, but our spider returns multiples items with the same id:

```
from itemadapter import ItemAdapter
from scrapy.exceptions import DropItem

class DuplicatesPipeline:
    def __init__(self):
        self.ids_seen = set()

    def process_item(self, item, spider):
        adapter = ItemAdapter(item)
        if adapter["id"] in self.ids_seen:
            raise DropItem(f"Item ID already seen: {adapter['id']}")
        else:
            self.ids_seen.add(adapter["id"])
            return item
```

3.7.3 Activating an Item Pipeline component

To activate an Item Pipeline component you must add its class to the *ITEM_PIPELINES* setting, like in the following example:

```
ITEM_PIPELINES = {
    "myproject.pipelines.PricePipeline": 300,
    "myproject.pipelines.JsonWriterPipeline": 800,
}
```

The integer values you assign to classes in this setting determine the order in which they run: items go through from lower valued to higher valued classes. It's customary to define these numbers in the 0-1000 range.

3.8 Feed exports

One of the most frequently required features when implementing scrapers is being able to store the scraped data properly and, quite often, that means generating an "export file" with the scraped data (commonly called "export feed") to be consumed by other systems.

Scrapy provides this functionality out of the box with the Feed Exports, which allows you to generate feeds with the scraped items, using multiple serialization formats and storage backends.

This page provides detailed documentation for all feed export features. If you are looking for a step-by-step guide, check out Zyte's export guides.

3.8.1 Serialization formats

For serializing the scraped data, the feed exports use the *Item exporters*. These formats are supported out of the box:

- *JSON*
- *JSON lines*
- *CSV*
- *XML*

But you can also extend the supported format through the `FEED_EXPORTERS` setting.

JSON

- Value for the `format` key in the `FEEDS` setting: `json`
- Exporter used: `JsonItemExporter`
- See *this warning* if you're using JSON with large feeds.

JSON lines

- Value for the `format` key in the `FEEDS` setting: `jsonlines`
- Exporter used: `JsonLinesItemExporter`

CSV

- Value for the `format` key in the `FEEDS` setting: `csv`
- Exporter used: `CsvItemExporter`
- To specify columns to export, their order and their column names, use `FEED_EXPORT_FIELDS`. Other feed exporters can also use this option, but it is important for CSV because unlike many other export formats CSV uses a fixed header.

XML

- Value for the `format` key in the `FEEDS` setting: `xml`
- Exporter used: `XmlItemExporter`

Pickle

- Value for the `format` key in the `FEEDS` setting: `pickle`
- Exporter used: `PickleItemExporter`

Marshal

- Value for the `format` key in the *FEEDS* setting: `marshal`
- Exporter used: *MarshalItemExporter*

3.8.2 Storages

When using the feed exports you define where to store the feed using one or multiple URIs (through the *FEEDS* setting). The feed exports supports multiple storage backend types which are defined by the URI scheme.

The storages backends supported out of the box are:

- *Local filesystem*
- *FTP*
- *S3* (requires boto3)
- *Google Cloud Storage (GCS)* (requires google-cloud-storage)
- *Standard output*

Some storage backends may be unavailable if the required external libraries are not available. For example, the S3 backend is only available if the boto3 library is installed.

3.8.3 Storage URI parameters

The storage URI can also contain parameters that get replaced when the feed is being created. These parameters are:

- `%(time)s` - gets replaced by a timestamp when the feed is being created
- `%(name)s` - gets replaced by the spider name

Any other named parameter gets replaced by the spider attribute of the same name. For example, `%(site_id)s` would get replaced by the `spider.site_id` attribute the moment the feed is being created.

Here are some examples to illustrate:

- Store in FTP using one directory per spider:
  - `ftp://user:password@ftp.example.com/scraping/feeds/%(name)s/%(time)s.json`
- Store in S3 using one directory per spider:
  - `s3://mybucket/scraping/feeds/%(name)s/%(time)s.json`

> **Note**
>
> *Spider arguments* become spider attributes, hence they can also be used as storage URI parameters.

3.8.4 Storage backends

Local filesystem

The feeds are stored in the local filesystem.

- URI scheme: `file`
- Example URI: `file:///tmp/export.csv`
- Required external libraries: none

Note that for the local filesystem storage (only) you can omit the scheme if you specify an absolute path like `/tmp/export.csv` (Unix systems only). Alternatively you can also use a `pathlib.Path` object.

FTP

The feeds are stored in a FTP server.

- URI scheme: `ftp`
- Example URI: `ftp://user:pass@ftp.example.com/path/to/export.csv`
- Required external libraries: none

FTP supports two different connection modes: active or passive. Scrapy uses the passive connection mode by default. To use the active connection mode instead, set the *FEED_STORAGE_FTP_ACTIVE* setting to `True`.

The default value for the `overwrite` key in the *FEEDS* for this storage backend is: `True`.

Caution

The value `True` in `overwrite` will cause you to lose the previous version of your data.

This storage backend uses *delayed file delivery*.

S3

The feeds are stored on Amazon S3.

- URI scheme: `s3`
- Example URIs:
  - `s3://mybucket/path/to/export.csv`
  - `s3://aws_key:aws_secret@mybucket/path/to/export.csv`
- Required external libraries: boto3 >= 1.20.0

The AWS credentials can be passed as user/password in the URI, or they can be passed through the following settings:

- *AWS_ACCESS_KEY_ID*
- *AWS_SECRET_ACCESS_KEY*
- *AWS_SESSION_TOKEN* (only needed for temporary security credentials)

You can also define a custom ACL, custom endpoint, and region name for exported feeds using these settings:

- *FEED_STORAGE_S3_ACL*
- *AWS_ENDPOINT_URL*
- *AWS_REGION_NAME*

The default value for the `overwrite` key in the *FEEDS* for this storage backend is: `True`.

Caution

The value `True` in `overwrite` will cause you to lose the previous version of your data.

This storage backend uses *delayed file delivery*.

Google Cloud Storage (GCS)

Added in version 2.3.

The feeds are stored on Google Cloud Storage.

- URI scheme: `gs`
- Example URIs:
  - `gs://mybucket/path/to/export.csv`
- Required external libraries: google-cloud-storage.

For more information about authentication, please refer to Google Cloud documentation.

You can set a *Project ID* and *Access Control List (ACL)* through the following settings:

- *FEED_STORAGE_GCS_ACL*
- *GCS_PROJECT_ID*

The default value for the `overwrite` key in the *FEEDS* for this storage backend is: `True`.

Caution

The value `True` in `overwrite` will cause you to lose the previous version of your data.

This storage backend uses *delayed file delivery*.

Standard output

The feeds are written to the standard output of the Scrapy process.

- URI scheme: `stdout`
- Example URI: `stdout:`
- Required external libraries: none

Delayed file delivery

As indicated above, some of the described storage backends use delayed file delivery.

These storage backends do not upload items to the feed URI as those items are scraped. Instead, Scrapy writes items into a temporary local file, and only once all the file contents have been written (i.e. at the end of the crawl) is that file uploaded to the feed URI.

If you want item delivery to start earlier when using one of these storage backends, use *FEED_EXPORT_BATCH_ITEM_COUNT* to split the output items in multiple files, with the specified maximum item count per file. That way, as soon as a file reaches the maximum item count, that file is delivered to the feed URI, allowing item delivery to start way before the end of the crawl.

3.8.5 Item filtering

Added in version 2.6.0.

You can filter items that you want to allow for a particular feed by using the `item_classes` option in *feeds options*. Only items of the specified types will be added to the feed.

The `item_classes` option is implemented by the *ItemFilter* class, which is the default value of the `item_filter` *feed option*.

You can create your own custom filtering class by implementing *ItemFilter*'s method `accepts` and taking `feed_options` as an argument.

For instance:

```
class MyCustomFilter:
    def __init__(self, feed_options):
        self.feed_options = feed_options

    def accepts(self, item):
        if "field1" in item and item["field1"] == "expected_data":
            return True
        return False
```

You can assign your custom filtering class to the `item_filter` *option of a feed*. See *FEEDS* for examples.

ItemFilter

class scrapy.extensions.feedexport.**ItemFilter**(*feed_options: dict[str, Any] | None*)

This will be used by FeedExporter to decide if an item should be allowed to be exported to a particular feed.

Parameters
feed_options (*dict*) – feed specific options passed from FeedExporter

accepts(*item: Any*) → bool

Return `True` if *item* should be exported or `False` otherwise.

Parameters
item (*Scrapy items*) – scraped item which user wants to check if is acceptable

Returns
True if accepted, *False* otherwise

Return type
bool

3.8.6 Post-Processing

Added in version 2.6.0.

Scrapy provides an option to activate plugins to post-process feeds before they are exported to feed storages. In addition to using *builtin plugins*, you can create your own *plugins*.

These plugins can be activated through the `postprocessing` option of a feed. The option must be passed a list of post-processing plugins in the order you want the feed to be processed. These plugins can be declared either as an import string or with the imported class of the plugin. Parameters to plugins can be passed through the feed options. See *feed options* for examples.

Built-in Plugins

class scrapy.extensions.postprocessing.**GzipPlugin**(*file: BinaryIO*, *feed_options: dict[str, Any]*)

Compresses received data using gzip.

Accepted `feed_options` parameters:

- *gzip_compresslevel*
- *gzip_mtime*
- *gzip_filename*

See `gzip.GzipFile` for more info about parameters.

class scrapy.extensions.postprocessing.**LZMAPlugin**(*file: BinaryIO*, *feed_options: dict[str, Any]*)

Compresses received data using lzma.

Accepted `feed_options` parameters:

- *lzma_format*
- *lzma_check*
- *lzma_preset*
- *lzma_filters*

> **Note**
>
> `lzma_filters` cannot be used in pypy version 7.3.1 and older.

See `lzma.LZMAFile` for more info about parameters.

class scrapy.extensions.postprocessing.**Bz2Plugin**(*file: BinaryIO*, *feed_options: dict[str, Any]*)

Compresses received data using bz2.

Accepted `feed_options` parameters:

- *bz2_compresslevel*

See `bz2.BZ2File` for more info about parameters.

Custom Plugins

Each plugin is a class that must implement the following methods:

__init__(*self*, *file*, *feed_options*)

Initialize the plugin.

Parameters

- **file** – file-like object having at least the *write*, *tell* and *close* methods implemented
- **feed_options** (`dict`) – feed-specific *options*

write(*self*, *data*)

Process and write *data* (`bytes` or `memoryview`) into the plugin's target file. It must return number of bytes written.

close(*self*)

Clean up the plugin.

For example, you might want to close a file wrapper that you might have used to compress data written into the file received in the `__init__` method.

> **Warning**
>
> Do not close the file from the `__init__` method.

To pass a parameter to your plugin, use *feed options*. You can then access those parameters from the `__init__` method of your plugin.

3.8.7 Settings

These are the settings used for configuring the feed exports:

- *FEEDS* (mandatory)
- *FEED_EXPORT_ENCODING*
- *FEED_STORE_EMPTY*
- *FEED_EXPORT_FIELDS*
- *FEED_EXPORT_INDENT*
- *FEED_STORAGES*
- *FEED_STORAGE_FTP_ACTIVE*
- *FEED_STORAGE_S3_ACL*
- *FEED_EXPORTERS*
- *FEED_EXPORT_BATCH_ITEM_COUNT*

FEEDS

Added in version 2.1.

Default: `{}`

A dictionary in which every key is a feed URI (or a `pathlib.Path` object) and each value is a nested dictionary containing configuration parameters for the specific feed.

This setting is required for enabling the feed export feature.

See *Storage backends* for supported URI schemes.

For instance:

```
{
    'items.json': {
        'format': 'json',
        'encoding': 'utf8',
        'store_empty': False,
        'item_classes': [MyItemClass1, 'myproject.items.MyItemClass2'],
        'fields': None,
        'indent': 4,
        'item_export_kwargs': {
           'export_empty_fields': True,
        },
    },
    '/home/user/documents/items.xml': {
        'format': 'xml',
        'fields': ['name', 'price'],
        'item_filter': MyCustomFilter1,
        'encoding': 'latin1',
        'indent': 8,
    },
    pathlib.Path('items.csv.gz'): {
        'format': 'csv',
        'fields': ['price', 'name'],
        'item_filter': 'myproject.filters.MyCustomFilter2',
```

(continues on next page)

(continued from previous page)

```
        'postprocessing': [MyPlugin1, 'scrapy.extensions.postprocessing.GzipPlugin'],
        'gzip_compresslevel': 5,
    },
}
```

The following is a list of the accepted keys and the setting that is used as a fallback value if that key is not provided for a specific feed definition:

- `format`: the *serialization format*.

  This setting is mandatory, there is no fallback value.

- `batch_item_count`: falls back to *FEED_EXPORT_BATCH_ITEM_COUNT*.

  Added in version 2.3.0.

- `encoding`: falls back to *FEED_EXPORT_ENCODING*.

- `fields`: falls back to *FEED_EXPORT_FIELDS*.

- `item_classes`: list of *item classes* to export.

  If undefined or empty, all items are exported.

  Added in version 2.6.0.

- `item_filter`: a *filter class* to filter items to export.

  ItemFilter is used be default.

  Added in version 2.6.0.

- `indent`: falls back to *FEED_EXPORT_INDENT*.

- `item_export_kwargs`: `dict` with keyword arguments for the corresponding *item exporter class*.

  Added in version 2.4.0.

- `overwrite`: whether to overwrite the file if it already exists (`True`) or append to its content (`False`).

  The default value depends on the *storage backend*:

  - *Local filesystem*: `False`
  - *FTP*: `True`

    Note

    Some FTP servers may not support appending to files (the `APPE` FTP command).

  - *S3*: `True` (appending is not supported)
  - *Google Cloud Storage (GCS)*: `True` (appending is not supported)
  - *Standard output*: `False` (overwriting is not supported)

  Added in version 2.4.0.

- `store_empty`: falls back to *FEED_STORE_EMPTY*.

- `uri_params`: falls back to *FEED_URI_PARAMS*.

- `postprocessing`: list of *plugins* to use for post-processing.

  The plugins will be used in the order of the list passed.

  Added in version 2.6.0.

FEED_EXPORT_ENCODING

Default: `"utf-8"` (*fallback*: `None`)

The encoding to be used for the feed.

If set to `None`, it uses UTF-8 for everything except JSON output, which uses safe numeric encoding (`\uXXXX` sequences) for historic reasons.

Use `"utf-8"` if you want UTF-8 for JSON too.

Changed in version 2.8: The *startproject* command now sets this setting to `"utf-8"` in the generated `settings.py` file.

FEED_EXPORT_FIELDS

Default: `None`

Use the `FEED_EXPORT_FIELDS` setting to define the fields to export, their order and their output names. See *BaseItemExporter.fields_to_export* for more information.

FEED_EXPORT_INDENT

Default: `0`

Amount of spaces used to indent the output on each level. If `FEED_EXPORT_INDENT` is a non-negative integer, then array elements and object members will be pretty-printed with that indent level. An indent level of `0` (the default), or negative, will put each item on a new line. `None` selects the most compact representation.

Currently implemented only by *JsonItemExporter* and *XmlItemExporter*, i.e. when you are exporting to `.json` or `.xml`.

FEED_STORE_EMPTY

Default: `True`

Whether to export empty feeds (i.e. feeds with no items). If `False`, and there are no items to export, no new files are created and existing files are not modified, even if the *overwrite feed option* is enabled.

FEED_STORAGES

Default: `{}`

A dict containing additional feed storage backends supported by your project. The keys are URI schemes and the values are paths to storage classes.

FEED_STORAGE_FTP_ACTIVE

Default: `False`

Whether to use the active connection mode when exporting feeds to an FTP server (`True`) or use the passive connection mode instead (`False`, default).

For information about FTP connection modes, see What is the difference between active and passive FTP?.

FEED_STORAGE_S3_ACL

Default: `''` (empty string)

A string containing a custom ACL for feeds exported to Amazon S3 by your project.

For a complete list of available values, access the Canned ACL section on Amazon S3 docs.

FEED_STORAGES_BASE

Default:

```
{
    "": "scrapy.extensions.feedexport.FileFeedStorage",
    "file": "scrapy.extensions.feedexport.FileFeedStorage",
    "stdout": "scrapy.extensions.feedexport.StdoutFeedStorage",
    "s3": "scrapy.extensions.feedexport.S3FeedStorage",
    "ftp": "scrapy.extensions.feedexport.FTPFeedStorage",
}
```

A dict containing the built-in feed storage backends supported by Scrapy. You can disable any of these backends by assigning `None` to their URI scheme in *FEED_STORAGES*. E.g., to disable the built-in FTP storage backend (without replacement), place this in your `settings.py`:

```
FEED_STORAGES = {
    "ftp": None,
}
```

FEED_EXPORTERS

Default: `{}`

A dict containing additional exporters supported by your project. The keys are serialization formats and the values are paths to *Item exporter* classes.

FEED_EXPORTERS_BASE

Default:

```
{
    "json": "scrapy.exporters.JsonItemExporter",
    "jsonlines": "scrapy.exporters.JsonLinesItemExporter",
    "jsonl": "scrapy.exporters.JsonLinesItemExporter",
    "jl": "scrapy.exporters.JsonLinesItemExporter",
    "csv": "scrapy.exporters.CsvItemExporter",
    "xml": "scrapy.exporters.XmlItemExporter",
    "marshal": "scrapy.exporters.MarshalItemExporter",
    "pickle": "scrapy.exporters.PickleItemExporter",
}
```

A dict containing the built-in feed exporters supported by Scrapy. You can disable any of these exporters by assigning `None` to their serialization format in *FEED_EXPORTERS*. E.g., to disable the built-in CSV exporter (without replacement), place this in your `settings.py`:

```
FEED_EXPORTERS = {
    "csv": None,
}
```

FEED_EXPORT_BATCH_ITEM_COUNT

Added in version 2.3.0.

Default: `0`

If assigned an integer number higher than `0`, Scrapy generates multiple output files storing up to the specified number of items in each output file.

When generating multiple output files, you must use at least one of the following placeholders in the feed URI to indicate how the different output file names are generated:

- `%(batch_time)s` - gets replaced by a timestamp when the feed is being created (e.g. `2020-03-28T14-45-08.237134`)
- `%(batch_id)d` - gets replaced by the 1-based sequence number of the batch.

  Use printf-style string formatting to alter the number format. For example, to make the batch ID a 5-digit number by introducing leading zeroes as needed, use `%(batch_id)05d` (e.g. `3` becomes `00003`, `123` becomes `00123`).

For instance, if your settings include:

```
FEED_EXPORT_BATCH_ITEM_COUNT = 100
```

And your *crawl* command line is:

```
scrapy crawl spidername -o "dirname/%(batch_id)d-filename%(batch_time)s.json"
```

The command line above can generate a directory tree like:

```
->projectname
-->dirname
--->1-filename2020-03-28T14-45-08.237134.json
--->2-filename2020-03-28T14-45-09.148903.json
--->3-filename2020-03-28T14-45-10.046092.json
```

Where the first and second files contain exactly 100 items. The last one contains 100 items or fewer.

FEED_URI_PARAMS

Default: `None`

A string with the import path of a function to set the parameters to apply with printf-style string formatting to the feed URI.

The function signature should be as follows:

`scrapy.extensions.feedexport.`**`uri_params`**`(`*params*, *spider*`)`

Return a `dict` of key-value pairs to apply to the feed URI using printf-style string formatting.

Parameters

- **`params`** (*`dict`*) – default key-value pairs

  Specifically:

  – `batch_id`: ID of the file batch. See *`FEED_EXPORT_BATCH_ITEM_COUNT`*.

  If *`FEED_EXPORT_BATCH_ITEM_COUNT`* is `0`, `batch_id` is always `1`.

  Added in version 2.3.0.

- batch_time: UTC date and time, in ISO format with : replaced with -.

  See *FEED_EXPORT_BATCH_ITEM_COUNT*.

  Added in version 2.3.0.

- time: batch_time, with microseconds set to 0.

- **spider** (scrapy.Spider) – source spider of the feed items

Caution

The function should return a new dictionary, modifying the received params in-place is deprecated.

For example, to include the *name* of the source spider in the feed URI:

1. Define the following function somewhere in your project:

```
# myproject/utils.py
def uri_params(params, spider):
    return {**params, "spider_name": spider.name}
```

2. Point *FEED_URI_PARAMS* to that function in your settings:

```
# myproject/settings.py
FEED_URI_PARAMS = "myproject.utils.uri_params"
```

3. Use %(spider_name)s in your feed URI:

```
scrapy crawl <spider_name> -o "%(spider_name)s.jsonl"
```

3.9 Requests and Responses

Scrapy uses *Request* and *Response* objects for crawling web sites.

Typically, *Request* objects are generated in the spiders and pass across the system until they reach the Downloader, which executes the request and returns a *Response* object which travels back to the spider that issued the request.

Both *Request* and *Response* classes have subclasses which add functionality not required in the base classes. These are described below in *Request subclasses* and *Response subclasses*.

3.9.1 Request objects

class scrapy.**Request**(**args: Any*, ***kwargs: Any*)

Represents an HTTP request, which is usually generated in a Spider and executed by the Downloader, thus generating a *Response*.

Parameters

- **url** (*str*) – the URL of this request

  If the URL is invalid, a ValueError exception is raised.

- **callback** (*Callable[Concatenate[Response, ...], Any] | None*) – sets *callback*, defaults to None.

  Changed in version 2.0: The *callback* parameter is no longer required when the *errback* parameter is specified.

- **method** (*str*) – the HTTP method of this request. Defaults to `'GET'`.
- **meta** (*dict*) – the initial values for the *Request.meta* attribute. If given, the dict passed in this parameter will be shallow copied.
- **body** (*bytes or str*) – the request body. If a string is passed, then it's encoded as bytes using the `encoding` passed (which defaults to `utf-8`). If `body` is not given, an empty bytes object is stored. Regardless of the type of this argument, the final value stored will be a bytes object (never a string or `None`).
- **headers** (*dict*) – the headers of this request. The dict values can be strings (for single valued headers) or lists (for multi-valued headers). If `None` is passed as value, the HTTP header will not be sent at all.

> **Caution**
>
> Cookies set via the `Cookie` header are not considered by the *CookiesMiddleware*. If you need to set cookies for a request, use the `cookies` argument. This is a known current limitation that is being worked on.

- **cookies** (*dict or list*) – the request cookies. These can be sent in two forms.

  1. Using a dict:

```
request_with_cookies = Request(
    url="http://www.example.com",
    cookies={"currency": "USD", "country": "UY"},
)
```

  2. Using a list of dicts:

```
request_with_cookies = Request(
    url="https://www.example.com",
    cookies=[
        {
            "name": "currency",
            "value": "USD",
            "domain": "example.com",
            "path": "/currency",
            "secure": True,
        },
    ],
)
```

  The latter form allows for customizing the `domain` and `path` attributes of the cookie. This is only useful if the cookies are saved for later requests. When some site returns cookies (in a response) those are stored in the cookies for that domain and will be sent again in future requests. That's the typical behaviour of any regular web browser.

  Note that setting the *dont_merge_cookies* key to `True` in *request.meta* causes custom cookies to be ignored.

  For more info see *CookiesMiddleware*.

> **Caution**
>
> Cookies set via the `Cookie` header are not considered by the *CookiesMiddleware*. If you need to set cookies for a request, use the *`scrapy.Request.cookies`* parameter. This is a known current limitation that is being worked on.

Added in version 2.6.0: Cookie values that are `bool`, `float` or `int` are casted to `str`.

- **`encoding`** (*`str`*) – the encoding of this request (defaults to `'utf-8'`). This encoding will be used to percent-encode the URL and to convert the body to bytes (if given as a string).
- **`priority`** (*`int`*) – sets *`priority`*, defaults to `0`.
- **`dont_filter`** (*`bool`*) – sets *`dont_filter`*, defaults to `False`.
- **`errback`** (*`Callable[[Failure], Any] | None`*) – sets *`errback`*, defaults to `None`.

  Changed in version 2.0: The *callback* parameter is no longer required when the *errback* parameter is specified.
- **`flags`** (*`list`*) – Flags sent to the request, can be used for logging or similar purposes.
- **`cb_kwargs`** (*`dict`*) – A dict with arbitrary data that will be passed as keyword arguments to the Request's callback.

`url`

A string containing the URL of this request. Keep in mind that this attribute contains the escaped URL, so it can differ from the URL passed in the `__init__()` method.

This attribute is read-only. To change the URL of a Request use *`replace()`*.

`method`

A string representing the HTTP method in the request. This is guaranteed to be uppercase. Example: `"GET"`, `"POST"`, `"PUT"`, etc

`headers`

A dictionary-like (`scrapy.http.headers.Headers`) object which contains the request headers.

`body`

The request body as bytes.

This attribute is read-only. To change the body of a Request use *`replace()`*.

`callback: CallbackT | None`

`Callable` to parse the *`Response`* to this request once received.

The callable must expect the response as its first parameter, and support any additional keyword arguments set through *`cb_kwargs`*.

In addition to an arbitrary callable, the following values are also supported:

- `None` (default), which indicates that the *`parse()`* method of the spider must be used.
- *`NO_CALLBACK()`*.

If an unhandled exception is raised during request or response processing, i.e. by a *spider middleware*, *downloader middleware* or download handler (*`DOWNLOAD_HANDLERS`*), *`errback`* is called instead.

> **Tip**
>
> *HttpErrorMiddleware* raises exceptions for non-2xx responses by default, sending them to the *errback* instead.

> **See also**
>
> *Passing additional data to callback functions*

errback: Callable[[Failure], Any] | None

Callable to handle exceptions raised during request or response processing.

The callable must expect a Failure as its first parameter.

> **See also**
>
> *Using errbacks to catch exceptions in request processing*

priority: int

Default: 0

Value that the *scheduler* may use for request prioritization.

Built-in schedulers prioritize requests with a higher priority value.

Negative values are allowed.

cb_kwargs

A dictionary that contains arbitrary metadata for this request. Its contents will be passed to the Request's callback as keyword arguments. It is empty for new Requests, which means by default callbacks only get a *Response* object as argument.

This dict is shallow copied when the request is cloned using the `copy()` or `replace()` methods, and can also be accessed, in your spider, from the `response.cb_kwargs` attribute.

In case of a failure to process the request, this dict can be accessed as `failure.request.cb_kwargs` in the request's errback. For more information, see *Accessing additional data in errback functions*.

meta = {}

A dictionary of arbitrary metadata for the request.

You may extend request metadata as you see fit.

Request metadata can also be accessed through the *meta* attribute of a response.

To pass data from one spider callback to another, consider using *cb_kwargs* instead. However, request metadata may be the right choice in certain scenarios, such as to maintain some debugging data across all follow-up requests (e.g. the source URL).

A common use of request metadata is to define request-specific parameters for Scrapy components (extensions, middlewares, etc.). For example, if you set `dont_retry` to `True`, *RetryMiddleware* will never retry that request, even if it fails. See *Request.meta special keys*.

You may also use request metadata in your custom Scrapy components, for example, to keep request state information relevant to your component. For example, `RetryMiddleware` uses the `retry_times` metadata key to keep track of how many times a request has been retried so far.

Copying all the metadata of a previous request into a new, follow-up request in a spider callback is a bad practice, because request metadata may include metadata set by Scrapy components that is not meant to be copied into other requests. For example, copying the `retry_times` metadata key into follow-up requests can lower the amount of retries allowed for those follow-up requests.

You should only copy all request metadata from one request to another if the new request is meant to replace the old request, as is often the case when returning a request from a *downloader middleware* method.

Also mind that the `copy()` and `replace()` request methods shallow-copy request metadata.

dont_filter: bool

Whether this request may be filtered out by *components* that support filtering out requests (`False`, default), or those components should not filter out this request (`True`).

This attribute is commonly set to `True` to prevent duplicate requests from being filtered out.

When defining the start URLs of a spider through `start_urls`, this attribute is enabled by default. See `start()`.

attributes: tuple[str, ...] = ('url', 'callback', 'method', 'headers', 'body', 'cookies', 'meta', 'encoding', 'priority', 'dont_filter', 'errback', 'flags', 'cb_kwargs')

A tuple of `str` objects containing the name of all public attributes of the class that are also keyword parameters of the `__init__()` method.

Currently used by `Request.replace()`, `Request.to_dict()` and `request_from_dict()`.

copy()

Return a new Request which is a copy of this Request. See also: *Passing additional data to callback functions*.

replace([*url*, *method*, *headers*, *body*, *cookies*, *meta*, *flags*, *encoding*, *priority*, *dont_filter*, *callback*, *errback*, *cb_kwargs*])

Return a Request object with the same members, except for those members given new values by whichever keyword arguments are specified. The `cb_kwargs` and `meta` attributes are shallow copied by default (unless new values are given as arguments). See also *Passing additional data to callback functions*.

classmethod from_curl(*curl_command: str*, *ignore_unknown_options: bool = True*, ***kwargs: Any*) → Self

Create a Request object from a string containing a cURL command. It populates the HTTP method, the URL, the headers, the cookies and the body. It accepts the same arguments as the `Request` class, taking preference and overriding the values of the same arguments contained in the cURL command.

Unrecognized options are ignored by default. To raise an error when finding unknown options call this method by passing `ignore_unknown_options=False`.

> **Caution**
>
> Using `from_curl()` from `Request` subclasses, such as `JsonRequest`, or `XmlRpcRequest`, as well as having *downloader middlewares* and *spider middlewares* enabled, such as `DefaultHeadersMiddleware`, `UserAgentMiddleware`, or `HttpCompressionMiddleware`, may modify the `Request` object.

To translate a cURL command into a Scrapy request, you may use curl2scrapy.

to_dict(*, *spider:* Spider | *None* = *None*) → dict[str, Any]

Return a dictionary containing the Request's data.

Use *request_from_dict()* to convert back into a *Request* object.

If a spider is given, this method will try to find out the name of the spider methods used as callback and errback and include them in the output dict, raising an exception if they cannot be found.

Other functions related to requests

scrapy.http.request.**NO_CALLBACK**(**args: Any*, ***kwargs: Any*) → NoReturn

When assigned to the `callback` parameter of *Request*, it indicates that the request is not meant to have a spider callback at all.

For example:

```
Request("https://example.com", callback=NO_CALLBACK)
```

This value should be used by *components* that create and handle their own requests, e.g. through `scrapy.core.engine.ExecutionEngine.download()`, so that downloader middlewares handling such requests can treat them differently from requests intended for the *parse()* callback.

scrapy.utils.request.**request_from_dict**(*d: dict[str, Any]*, *, *spider:* Spider | *None* = *None*) → *Request*

Create a *Request* object from a dict.

If a spider is given, it will try to resolve the callbacks looking at the spider for methods with the same name.

Passing additional data to callback functions

The callback of a request is a function that will be called when the response of that request is downloaded. The callback function will be called with the downloaded *Response* object as its first argument.

Example:

```
def parse_page1(self, response):
    return scrapy.Request(
        "http://www.example.com/some_page.html", callback=self.parse_page2
    )

def parse_page2(self, response):
    # this would log http://www.example.com/some_page.html
    self.logger.info("Visited %s", response.url)
```

In some cases you may be interested in passing arguments to those callback functions so you can receive the arguments later, in the second callback. The following example shows how to achieve this by using the *Request.cb_kwargs* attribute:

```
def parse(self, response):
    request = scrapy.Request(
        "http://www.example.com/index.html",
        callback=self.parse_page2,
        cb_kwargs=dict(main_url=response.url),
    )
    request.cb_kwargs["foo"] = "bar"  # add more arguments for the callback
```

(continues on next page)

(continued from previous page)

```
    yield request

def parse_page2(self, response, main_url, foo):
    yield dict(
        main_url=main_url,
        other_url=response.url,
        foo=foo,
    )
```

Caution

Request.cb_kwargs was introduced in version 1.7. Prior to that, using *Request.meta* was recommended for passing information around callbacks. After 1.7, *Request.cb_kwargs* became the preferred way for handling user information, leaving *Request.meta* for communication with components like middlewares and extensions.

Using errbacks to catch exceptions in request processing

The errback of a request is a function that will be called when an exception is raise while processing it.

It receives a `Failure` as first parameter and can be used to track connection establishment timeouts, DNS errors etc.

Here's an example spider logging all errors and catching some specific errors if needed:

```
import scrapy

from scrapy.spidermiddlewares.httperror import HttpError
from twisted.internet.error import DNSLookupError
from twisted.internet.error import TimeoutError, TCPTimedOutError

class ErrbackSpider(scrapy.Spider):
    name = "errback_example"
    start_urls = [
        "http://www.httpbin.org/",  # HTTP 200 expected
        "http://www.httpbin.org/status/404",  # Not found error
        "http://www.httpbin.org/status/500",  # server issue
        "http://www.httpbin.org:12345/",  # non-responding host, timeout expected
        "https://example.invalid/",  # DNS error expected
    ]

    async def start(self):
        for u in self.start_urls:
            yield scrapy.Request(
                u,
                callback=self.parse_httpbin,
                errback=self.errback_httpbin,
                dont_filter=True,
            )

    def parse_httpbin(self, response):
        self.logger.info("Got successful response from {}".format(response.url))
```

(continues on next page)

(continued from previous page)

```
        # do something useful here...

    def errback_httpbin(self, failure):
        # log all failures
        self.logger.error(repr(failure))

        # in case you want to do something special for some errors,
        # you may need the failure's type:

        if failure.check(HttpError):
            # these exceptions come from HttpError spider middleware
            # you can get the non-200 response
            response = failure.value.response
            self.logger.error("HttpError on %s", response.url)

        elif failure.check(DNSLookupError):
            # this is the original request
            request = failure.request
            self.logger.error("DNSLookupError on %s", request.url)

        elif failure.check(TimeoutError, TCPTimedOutError):
            request = failure.request
            self.logger.error("TimeoutError on %s", request.url)
```

Accessing additional data in errback functions

In case of a failure to process the request, you may be interested in accessing arguments to the callback functions so you can process further based on the arguments in the errback. The following example shows how to achieve this by using `Failure.request.cb_kwargs`:

```
def parse(self, response):
    request = scrapy.Request(
        "http://www.example.com/index.html",
        callback=self.parse_page2,
        errback=self.errback_page2,
        cb_kwargs=dict(main_url=response.url),
    )
    yield request

def parse_page2(self, response, main_url):
    pass

def errback_page2(self, failure):
    yield dict(
        main_url=failure.request.cb_kwargs["main_url"],
    )
```

Request fingerprints

There are some aspects of scraping, such as filtering out duplicate requests (see *DUPEFILTER_CLASS*) or caching responses (see *HTTPCACHE_POLICY*), where you need the ability to generate a short, unique identifier from a *Request* object: a request fingerprint.

You often do not need to worry about request fingerprints, the default request fingerprinter works for most projects.

However, there is no universal way to generate a unique identifier from a request, because different situations require comparing requests differently. For example, sometimes you may need to compare URLs case-insensitively, include URL fragments, exclude certain URL query parameters, include some or all headers, etc.

To change how request fingerprints are built for your requests, use the *REQUEST_FINGERPRINTER_CLASS* setting.

REQUEST_FINGERPRINTER_CLASS

Added in version 2.7.

Default: *scrapy.utils.request.RequestFingerprinter*

A *request fingerprinter class* or its import path.

class scrapy.utils.request.**RequestFingerprinter**(*crawler:* Crawler | *None* = *None*)

Default fingerprinter.

It takes into account a canonical version (w3lib.url.canonicalize_url()) of *request.url* and the values of *request.method* and *request.body*. It then generates an SHA1 hash.

Writing your own request fingerprinter

A request fingerprinter is a *component* that must implement the following method:

fingerprint(*self*, *request:* scrapy.Request)

Return a bytes object that uniquely identifies *request*.

See also *Request fingerprint restrictions*.

The *fingerprint()* method of the default request fingerprinter, *scrapy.utils.request.RequestFingerprinter*, uses *scrapy.utils.request.fingerprint()* with its default parameters. For some common use cases you can use *scrapy.utils.request.fingerprint()* as well in your *fingerprint()* method implementation:

scrapy.utils.request.**fingerprint**(*request:* Request, *, *include_headers: Iterable[bytes | str] | None = None*, *keep_fragments: bool = False*) → bytes

Return the request fingerprint.

The request fingerprint is a hash that uniquely identifies the resource the request points to. For example, take the following two urls: http://www.example.com/query?id=111&cat=222, http://www.example.com/query?cat=222&id=111.

Even though those are two different URLs both point to the same resource and are equivalent (i.e. they should return the same response).

Another example are cookies used to store session ids. Suppose the following page is only accessible to authenticated users: http://www.example.com/members/offers.html.

Lots of sites use a cookie to store the session id, which adds a random component to the HTTP Request and thus should be ignored when calculating the fingerprint.

For this reason, request headers are ignored by default when calculating the fingerprint. If you want to include specific headers use the include_headers argument, which is a list of Request headers to include.

Also, servers usually ignore fragments in urls when handling requests, so they are also ignored by default when calculating the fingerprint. If you want to include them, set the keep_fragments argument to True (for instance when handling requests with a headless browser).

For example, to take the value of a request header named `X-ID` into account:

```
# my_project/settings.py
REQUEST_FINGERPRINTER_CLASS = "my_project.utils.RequestFingerprinter"

# my_project/utils.py
from scrapy.utils.request import fingerprint

class RequestFingerprinter:
    def fingerprint(self, request):
        return fingerprint(request, include_headers=["X-ID"])
```

You can also write your own fingerprinting logic from scratch.

However, if you do not use *scrapy.utils.request.fingerprint()*, make sure you use `WeakKeyDictionary` to cache request fingerprints:

- Caching saves CPU by ensuring that fingerprints are calculated only once per request, and not once per Scrapy component that needs the fingerprint of a request.
- Using `WeakKeyDictionary` saves memory by ensuring that request objects do not stay in memory forever just because you have references to them in your cache dictionary.

For example, to take into account only the URL of a request, without any prior URL canonicalization or taking the request method or body into account:

```
from hashlib import sha1
from weakref import WeakKeyDictionary

from scrapy.utils.python import to_bytes

class RequestFingerprinter:
    cache = WeakKeyDictionary()

    def fingerprint(self, request):
        if request not in self.cache:
            fp = sha1()
            fp.update(to_bytes(request.url))
            self.cache[request] = fp.digest()
        return self.cache[request]
```

If you need to be able to override the request fingerprinting for arbitrary requests from your spider callbacks, you may implement a request fingerprinter that reads fingerprints from *request.meta* when available, and then falls back to *scrapy.utils.request.fingerprint()*. For example:

```
from scrapy.utils.request import fingerprint

class RequestFingerprinter:
    def fingerprint(self, request):
```

(continues on next page)

(continued from previous page)

```
        if "fingerprint" in request.meta:
            return request.meta["fingerprint"]
        return fingerprint(request)
```

If you need to reproduce the same fingerprinting algorithm as Scrapy 2.6, use the following request fingerprinter:

```
from hashlib import sha1
from weakref import WeakKeyDictionary

from scrapy.utils.python import to_bytes
from w3lib.url import canonicalize_url

class RequestFingerprinter:
    cache = WeakKeyDictionary()

    def fingerprint(self, request):
        if request not in self.cache:
            fp = sha1()
            fp.update(to_bytes(request.method))
            fp.update(to_bytes(canonicalize_url(request.url)))
            fp.update(request.body or b"")
            self.cache[request] = fp.digest()
        return self.cache[request]
```

Request fingerprint restrictions

Scrapy components that use request fingerprints may impose additional restrictions on the format of the fingerprints that your *request fingerprinter* generates.

The following built-in Scrapy components have such restrictions:

- *scrapy.extensions.httpcache.FilesystemCacheStorage* (default value of *HTTPCACHE_STORAGE*)

  Request fingerprints must be at least 1 byte long.

  Path and filename length limits of the file system of *HTTPCACHE_DIR* also apply. Inside *HTTPCACHE_DIR*, the following directory structure is created:

  - *Spider.name*
    - first byte of a request fingerprint as hexadecimal
      - fingerprint as hexadecimal
      - filenames up to 16 characters long

  For example, if a request fingerprint is made of 20 bytes (default), *HTTPCACHE_DIR* is `'/home/user/project/.scrapy/httpcache'`, and the name of your spider is `'my_spider'` your file system must support a file path like:

  ```
  /home/user/project/.scrapy/httpcache/my_spider/01/
  ↪0123456789abcdef0123456789abcdef01234567/response_headers
  ```

- *scrapy.extensions.httpcache.DbmCacheStorage*

The underlying DBM implementation must support keys as long as twice the number of bytes of a request fingerprint, plus 5. For example, if a request fingerprint is made of 20 bytes (default), 45-character-long keys must be supported.

3.9.2 Request.meta special keys

The *Request.meta* attribute can contain any arbitrary data, but there are some special keys recognized by Scrapy and its built-in extensions.

Those are:

- *allow_offsite*
- *autothrottle_dont_adjust_delay*
- *bindaddress*
- *cookiejar*
- *dont_cache*
- *dont_merge_cookies*
- *dont_obey_robotstxt*
- *dont_redirect*
- *dont_retry*
- *download_fail_on_dataloss*
- *download_latency*
- *download_maxsize*
- *download_warnsize*
- *download_timeout*
- `ftp_password` (See *FTP_PASSWORD* for more info)
- `ftp_user` (See *FTP_USER* for more info)
- *handle_httpstatus_all*
- *handle_httpstatus_list*
- *is_start_request*
- *max_retry_times*
- *proxy*
- *redirect_reasons*
- *redirect_urls*
- *referrer_policy*

bindaddress

The IP of the outgoing IP address to use for the performing the request.

download_timeout

The amount of time (in secs) that the downloader will wait before timing out. See also: *DOWNLOAD_TIMEOUT*.

download_latency

The amount of time spent to fetch the response, since the request has been started, i.e. HTTP message sent over the network. This meta key only becomes available when the response has been downloaded. While most other meta keys are used to control Scrapy behavior, this one is supposed to be read-only.

download_fail_on_dataloss

Whether or not to fail on broken responses. See: *DOWNLOAD_FAIL_ON_DATALOSS*.

max_retry_times

The meta key is used set retry times per request. When initialized, the *max_retry_times* meta key takes higher precedence over the *RETRY_TIMES* setting.

3.9.3 Stopping the download of a Response

Raising a *StopDownload* exception from a handler for the *bytes_received* or *headers_received* signals will stop the download of a given response. See the following example:

```
import scrapy

class StopSpider(scrapy.Spider):
    name = "stop"
    start_urls = ["https://docs.scrapy.org/en/latest/"]

    @classmethod
    def from_crawler(cls, crawler):
        spider = super().from_crawler(crawler)
        crawler.signals.connect(
            spider.on_bytes_received, signal=scrapy.signals.bytes_received
        )
        return spider

    def parse(self, response):
        # 'last_chars' show that the full response was not downloaded
        yield {"len": len(response.text), "last_chars": response.text[-40:]}

    def on_bytes_received(self, data, request, spider):
        raise scrapy.exceptions.StopDownload(fail=False)
```

which produces the following output:

```
2020-05-19 17:26:12 [scrapy.core.engine] INFO: Spider opened
2020-05-19 17:26:12 [scrapy.extensions.logstats] INFO: Crawled 0 pages (at 0 pages/min),␣
↪scraped 0 items (at 0 items/min)
2020-05-19 17:26:13 [scrapy.core.downloader.handlers.http11] DEBUG: Download stopped for
↪<GET https://docs.scrapy.org/en/latest/> from signal handler StopSpider.on_bytes_
↪received
2020-05-19 17:26:13 [scrapy.core.engine] DEBUG: Crawled (200) <GET https://docs.scrapy.
```

(continues on next page)

(continued from previous page)

```
↪org/en/latest/> (referer: None) ['download_stopped']
2020-05-19 17:26:13 [scrapy.core.scraper] DEBUG: Scraped from <200 https://docs.scrapy.
↪org/en/latest/>
{'len': 279, 'last_chars': 'dth, initial-scale=1.0">\n  \n  <title>Scr'}
2020-05-19 17:26:13 [scrapy.core.engine] INFO: Closing spider (finished)
```

By default, resulting responses are handled by their corresponding errbacks. To call their callback instead, like in this example, pass `fail=False` to the *StopDownload* exception.

3.9.4 Request subclasses

Here is the list of built-in *Request* subclasses. You can also subclass it to implement your own custom functionality.

FormRequest objects

The FormRequest class extends the base *Request* with functionality for dealing with HTML forms. It uses lxml.html forms to pre-populate form fields with form data from *Response* objects.

class scrapy.**FormRequest**(*url*[, *formdata*, ...])

The *FormRequest* class adds a new keyword parameter to the `__init__()` method. The remaining arguments are the same as for the *Request* class and are not documented here.

Parameters

formdata (*dict or collections.abc.Iterable*) – is a dictionary (or iterable of (key, value) tuples) containing HTML Form data which will be url-encoded and assigned to the body of the request.

The *FormRequest* objects support the following class method in addition to the standard *Request* methods:

classmethod from_response(*response*[, *formname=None*, *formid=None*, *formnumber=0*, *formdata=None*, *formxpath=None*, *formcss=None*, *clickdata=None*, *dont_click=False*, ...])

Returns a new *FormRequest* object with its form field values pre-populated with those found in the HTML `<form>` element contained in the given response. For an example see *Using FormRequest.from_response() to simulate a user login*.

The policy is to automatically simulate a click, by default, on any form control that looks clickable, like a `<input type="submit">`. Even though this is quite convenient, and often the desired behaviour, sometimes it can cause problems which could be hard to debug. For example, when working with forms that are filled and/or submitted using javascript, the default *from_response()* behaviour may not be the most appropriate. To disable this behaviour you can set the `dont_click` argument to `True`. Also, if you want to change the control clicked (instead of disabling it) you can also use the `clickdata` argument.

> **Caution**
>
> Using this method with select elements which have leading or trailing whitespace in the option values will not work due to a bug in lxml, which should be fixed in lxml 3.8 and above.

Parameters

- **response** (*Response* object) – the response containing a HTML form which will be used to pre-populate the form fields
- **formname** (*str*) – if given, the form with name attribute set to this value will be used.

- **formid** (*str*) – if given, the form with id attribute set to this value will be used.
- **formxpath** (*str*) – if given, the first form that matches the xpath will be used.
- **formcss** (*str*) – if given, the first form that matches the css selector will be used.
- **formnumber** (*int*) – the number of form to use, when the response contains multiple forms. The first one (and also the default) is `0`.
- **formdata** (*dict*) – fields to override in the form data. If a field was already present in the response <form> element, its value is overridden by the one passed in this parameter. If a value passed in this parameter is `None`, the field will not be included in the request, even if it was present in the response <form> element.
- **clickdata** (*dict*) – attributes to lookup the control clicked. If it's not given, the form data will be submitted simulating a click on the first clickable element. In addition to html attributes, the control can be identified by its zero-based index relative to other submittable inputs inside the form, via the `nr` attribute.
- **dont_click** (*bool*) – If True, the form data will be submitted without clicking in any element.

The other parameters of this class method are passed directly to the *FormRequest* `__init__()` method.

Request usage examples

Using FormRequest to send data via HTTP POST

If you want to simulate a HTML Form POST in your spider and send a couple of key-value fields, you can return a *FormRequest* object (from your spider) like this:

```
return [
    FormRequest(
        url="http://www.example.com/post/action",
        formdata={"name": "John Doe", "age": "27"},
        callback=self.after_post,
    )
]
```

Using FormRequest.from_response() to simulate a user login

It is usual for web sites to provide pre-populated form fields through <input type="hidden"> elements, such as session related data or authentication tokens (for login pages). When scraping, you'll want these fields to be automatically pre-populated and only override a couple of them, such as the user name and password. You can use the *FormRequest.from_response()* method for this job. Here's an example spider which uses it:

```
import scrapy

def authentication_failed(response):
    # TODO: Check the contents of the response and return True if it failed
    # or False if it succeeded.
    pass

class LoginSpider(scrapy.Spider):
    name = "example.com"
```

(continues on next page)

(continued from previous page)

```
    start_urls = ["http://www.example.com/users/login.php"]

    def parse(self, response):
        return scrapy.FormRequest.from_response(
            response,
            formdata={"username": "john", "password": "secret"},
            callback=self.after_login,
        )

    def after_login(self, response):
        if authentication_failed(response):
            self.logger.error("Login failed")
            return

        # continue scraping with authenticated session...
```

JsonRequest

The JsonRequest class extends the base *Request* class with functionality for dealing with JSON requests.

class scrapy.http.**JsonRequest**(*url*[, ... *data*, *dumps_kwargs*])

The *JsonRequest* class adds two new keyword parameters to the `__init__()` method. The remaining arguments are the same as for the *Request* class and are not documented here.

Using the *JsonRequest* will set the `Content-Type` header to `application/json` and `Accept` header to `application/json, text/javascript, */*; q=0.01`

Parameters

- **data** (*object*) – is any JSON serializable object that needs to be JSON encoded and assigned to body. If the *body* argument is provided this parameter will be ignored. If the *body* argument is not provided and the `data` argument is provided the *method* will be set to `'POST'` automatically.
- **dumps_kwargs** (*dict*) – Parameters that will be passed to underlying `json.dumps()` method which is used to serialize data into JSON format.

attributes: tuple[str, ...] = ('url', 'callback', 'method', 'headers', 'body', 'cookies', 'meta', 'encoding', 'priority', 'dont_filter', 'errback', 'flags', 'cb_kwargs', 'dumps_kwargs')

A tuple of `str` objects containing the name of all public attributes of the class that are also keyword parameters of the `__init__()` method.

Currently used by *Request.replace()*, *Request.to_dict()* and *request_from_dict()*.

JsonRequest usage example

Sending a JSON POST request with a JSON payload:

```
data = {
    "name1": "value1",
    "name2": "value2",
}
yield JsonRequest(url="http://www.example.com/post/action", data=data)
```

3.9.5 Response objects

class scrapy.http.**Response**(**args: Any*, ***kwargs: Any*)

An object that represents an HTTP response, which is usually downloaded (by the Downloader) and fed to the Spiders for processing.

Parameters

- **url** (*str*) – the URL of this response
- **status** (*int*) – the HTTP status of the response. Defaults to `200`.
- **headers** (*dict*) – the headers of this response. The dict values can be strings (for single valued headers) or lists (for multi-valued headers).
- **body** (*bytes*) – the response body. To access the decoded text as a string, use `response.text` from an encoding-aware *Response subclass*, such as *TextResponse*.
- **flags** (*list*) – is a list containing the initial values for the *Response.flags* attribute. If given, the list will be shallow copied.
- **request** (`scrapy.Request`) – the initial value of the *Response.request* attribute. This represents the *Request* that generated this response.
- **certificate** (*twisted.internet.ssl.Certificate*) – an object representing the server's SSL certificate.
- **ip_address** (`ipaddress.IPv4Address` or `ipaddress.IPv6Address`) – The IP address of the server from which the Response originated.
- **protocol** (`str`) – The protocol that was used to download the response. For instance: "HTTP/1.0", "HTTP/1.1", "h2"

Added in version 2.0.0: The `certificate` parameter.

Added in version 2.1.0: The `ip_address` parameter.

Added in version 2.5.0: The `protocol` parameter.

url

A string containing the URL of the response.

This attribute is read-only. To change the URL of a Response use *replace()*.

status

An integer representing the HTTP status of the response. Example: `200`, `404`.

headers

A dictionary-like (`scrapy.http.headers.Headers`) object which contains the response headers. Values can be accessed using `get()` to return the first header value with the specified name or `getlist()` to return all header values with the specified name. For example, this call will give you all cookies in the headers:

```
response.headers.getlist('Set-Cookie')
```

body

The response body as bytes.

If you want the body as a string, use *TextResponse.text* (only available in *TextResponse* and subclasses).

This attribute is read-only. To change the body of a Response use *replace()*.

`request`

The *Request* object that generated this response. This attribute is assigned in the Scrapy engine, after the response and the request have passed through all *Downloader Middlewares*. In particular, this means that:

- HTTP redirections will create a new request from the request before redirection. It has the majority of the same metadata and original request attributes and gets assigned to the redirected response instead of the propagation of the original request.
- Response.request.url doesn't always equal Response.url
- This attribute is only available in the spider code, and in the *Spider Middlewares*, but not in Downloader Middlewares (although you have the Request available there by other means) and handlers of the *response_downloaded* signal.

`meta`

A shortcut to the *meta* attribute of the *Response.request* object (i.e. `self.request.meta`).

Unlike the *Response.request* attribute, the *Response.meta* attribute is propagated along redirects and retries, so you will get the original *Request.meta* sent from your spider.

See also

Request.meta attribute

`cb_kwargs`

Added in version 2.0.

A shortcut to the *cb_kwargs* attribute of the *Response.request* object (i.e. `self.request.cb_kwargs`).

Unlike the *Response.request* attribute, the *Response.cb_kwargs* attribute is propagated along redirects and retries, so you will get the original *Request.cb_kwargs* sent from your spider.

See also

Request.cb_kwargs attribute

`flags`

A list that contains flags for this response. Flags are labels used for tagging Responses. For example: `'cached'`, `'redirected'`, etc. And they're shown on the string representation of the Response (`__str__()` method) which is used by the engine for logging.

`certificate`

Added in version 2.0.0.

A `twisted.internet.ssl.Certificate` object representing the server's SSL certificate.

Only populated for `https` responses, `None` otherwise.

`ip_address`

Added in version 2.1.0.

The IP address of the server from which the Response originated.

This attribute is currently only populated by the HTTP 1.1 download handler, i.e. for `http(s)` responses. For other handlers, *ip_address* is always `None`.

protocol

Added in version 2.5.0.

The protocol that was used to download the response. For instance: "HTTP/1.0", "HTTP/1.1"

This attribute is currently only populated by the HTTP download handlers, i.e. for `http(s)` responses. For other handlers, *protocol* is always `None`.

attributes: tuple[str, ...] = ('url', 'status', 'headers', 'body', 'flags', 'request', 'certificate', 'ip_address', 'protocol')

A tuple of `str` objects containing the name of all public attributes of the class that are also keyword parameters of the `__init__()` method.

Currently used by *Response.replace()*.

copy()

Returns a new Response which is a copy of this Response.

replace([*url*, *status*, *headers*, *body*, *request*, *flags*, *cls*])

Returns a Response object with the same members, except for those members given new values by whichever keyword arguments are specified. The attribute *Response.meta* is copied by default.

urljoin(*url*)

Constructs an absolute url by combining the Response's *url* with a possible relative url.

This is a wrapper over `urljoin()`, it's merely an alias for making this call:

```
urllib.parse.urljoin(response.url, url)
```

follow(*url: str | Link, callback: CallbackT | None = None, method: str = 'GET', headers: Mapping[AnyStr, Any] | Iterable[tuple[AnyStr, Any]] | None = None, body: bytes | str | None = None, cookies: CookiesT | None = None, meta: dict[str, Any] | None = None, encoding: str | None = 'utf-8', priority: int = 0, dont_filter: bool = False, errback: Callable[[Failure], Any] | None = None, cb_kwargs: dict[str, Any] | None = None, flags: list[str] | None = None*) → *Request*

Return a *Request* instance to follow a link `url`. It accepts the same arguments as `Request.__init__()` method, but `url` can be a relative URL or a *Link* object, not only an absolute URL.

TextResponse provides a *follow()* method which supports selectors in addition to absolute/relative URLs and Link objects.

Added in version 2.0: The *flags* parameter.

follow_all(*urls: Iterable[str | Link], callback: CallbackT | None = None, method: str = 'GET', headers: Mapping[AnyStr, Any] | Iterable[tuple[AnyStr, Any]] | None = None, body: bytes | str | None = None, cookies: CookiesT | None = None, meta: dict[str, Any] | None = None, encoding: str | None = 'utf-8', priority: int = 0, dont_filter: bool = False, errback: Callable[[Failure], Any] | None = None, cb_kwargs: dict[str, Any] | None = None, flags: list[str] | None = None*) → Iterable[*Request*]

Added in version 2.0.

Return an iterable of *Request* instances to follow all links in `urls`. It accepts the same arguments as `Request.__init__()` method, but elements of `urls` can be relative URLs or *Link* objects, not only absolute URLs.

TextResponse provides a *follow_all()* method which supports selectors in addition to absolute/relative URLs and Link objects.

3.9.6 Response subclasses

Here is the list of available built-in Response subclasses. You can also subclass the Response class to implement your own functionality.

TextResponse objects

class scrapy.http.**TextResponse**(*url*[, *encoding*[, ...]])

TextResponse objects adds encoding capabilities to the base *Response* class, which is meant to be used only for binary data, such as images, sounds or any media file.

TextResponse objects support a new `__init__()` method argument, in addition to the base *Response* objects. The remaining functionality is the same as for the *Response* class and is not documented here.

Parameters

encoding (*str*) – is a string which contains the encoding to use for this response. If you create a *TextResponse* object with a string as body, it will be converted to bytes encoded using this encoding. If *encoding* is `None` (default), the encoding will be looked up in the response headers and body instead.

TextResponse objects support the following attributes in addition to the standard *Response* ones:

text

Response body, as a string.

The same as `response.body.decode(response.encoding)`, but the result is cached after the first call, so you can access `response.text` multiple times without extra overhead.

> **Note**
>
> `str(response.body)` is not a correct way to convert the response body into a string:
>
> ```
> >>> str(b"body")
> "b'body'"
> ```

encoding

A string with the encoding of this response. The encoding is resolved by trying the following mechanisms, in order:

1. the encoding passed in the `__init__()` method `encoding` argument
2. the encoding declared in the Content-Type HTTP header. If this encoding is not valid (i.e. unknown), it is ignored and the next resolution mechanism is tried.
3. the encoding declared in the response body. The TextResponse class doesn't provide any special functionality for this. However, the *HtmlResponse* and *XmlResponse* classes do.
4. the encoding inferred by looking at the response body. This is the more fragile method but also the last one tried.

selector

A *Selector* instance using the response as target. The selector is lazily instantiated on first access.

attributes: tuple[str, ...] = ('url', 'status', 'headers', 'body', 'flags', 'request', 'certificate', 'ip_address', 'protocol', 'encoding')

A tuple of `str` objects containing the name of all public attributes of the class that are also keyword parameters of the `__init__()` method.

Currently used by *Response.replace()*.

TextResponse objects support the following methods in addition to the standard *Response* ones:

jmespath(*query*)

A shortcut to `TextResponse.selector.jmespath(query)`:

```
response.jmespath('object.[*]')
```

xpath(*query*)

A shortcut to `TextResponse.selector.xpath(query)`:

```
response.xpath('//p')
```

css(*query*)

A shortcut to `TextResponse.selector.css(query)`:

```
response.css('p')
```

follow(*url: str | Link | parsel.Selector, callback: CallbackT | None = None, method: str = 'GET', headers: Mapping[AnyStr, Any] | Iterable[tuple[AnyStr, Any]] | None = None, body: bytes | str | None = None, cookies: CookiesT | None = None, meta: dict[str, Any] | None = None, encoding: str | None = None, priority: int = 0, dont_filter: bool = False, errback: Callable[[Failure], Any] | None = None, cb_kwargs: dict[str, Any] | None = None, flags: list[str] | None = None*) → *Request*

Return a *Request* instance to follow a link `url`. It accepts the same arguments as `Request.__init__()` method, but `url` can be not only an absolute URL, but also

- a relative URL
- a *Link* object, e.g. the result of *Link Extractors*
- a *Selector* object for a <link> or <a> element, e.g. `response.css('a.my_link')[0]`
- an attribute *Selector* (not SelectorList), e.g. `response.css('a::attr(href)')[0]` or `response.xpath('//img/@src')[0]`

See *A shortcut for creating Requests* for usage examples.

follow_all(*urls: Iterable[str | Link] | parsel.SelectorList | None = None, callback: CallbackT | None = None, method: str = 'GET', headers: Mapping[AnyStr, Any] | Iterable[tuple[AnyStr, Any]] | None = None, body: bytes | str | None = None, cookies: CookiesT | None = None, meta: dict[str, Any] | None = None, encoding: str | None = None, priority: int = 0, dont_filter: bool = False, errback: Callable[[Failure], Any] | None = None, cb_kwargs: dict[str, Any] | None = None, flags: list[str] | None = None, css: str | None = None, xpath: str | None = None*) → Iterable[*Request*]

A generator that produces *Request* instances to follow all links in `urls`. It accepts the same arguments as the *Request*'s `__init__()` method, except that each `urls` element does not need to be an absolute URL, it can be any of the following:

- a relative URL
- a *Link* object, e.g. the result of *Link Extractors*
- a *Selector* object for a <link> or <a> element, e.g. `response.css('a.my_link')[0]`
- an attribute *Selector* (not SelectorList), e.g. `response.css('a::attr(href)')[0]` or `response.xpath('//img/@src')[0]`

In addition, `css` and `xpath` arguments are accepted to perform the link extraction within the `follow_all()` method (only one of `urls`, `css` and `xpath` is accepted).

Note that when passing a `SelectorList` as argument for the `urls` parameter or using the `css` or `xpath` parameters, this method will not produce requests for selectors from which links cannot be obtained (for instance, anchor tags without an `href` attribute)

json()

Added in version 2.2.

Deserialize a JSON document to a Python object.

Returns a Python object from deserialized JSON document. The result is cached after the first call.

urljoin(*url*)

Constructs an absolute url by combining the Response's base url with a possible relative url. The base url shall be extracted from the <base> tag, or just *Response.url* if there is no such tag.

HtmlResponse objects

class scrapy.http.**HtmlResponse**(*url*[, ...])

The *HtmlResponse* class is a subclass of *TextResponse* which adds encoding auto-discovering support by looking into the HTML meta http-equiv attribute. See *TextResponse.encoding*.

XmlResponse objects

class scrapy.http.**XmlResponse**(*url*[, ...])

The *XmlResponse* class is a subclass of *TextResponse* which adds encoding auto-discovering support by looking into the XML declaration line. See *TextResponse.encoding*.

JsonResponse objects

class scrapy.http.**JsonResponse**(*url*[, ...])

The *JsonResponse* class is a subclass of *TextResponse* that is used when the response has a JSON MIME type in its *Content-Type* header.

3.10 Link Extractors

A link extractor is an object that extracts links from responses.

The `__init__` method of *LxmlLinkExtractor* takes settings that determine which links may be extracted. *LxmlLinkExtractor.extract_links* returns a list of matching *Link* objects from a *Response* object.

Link extractors are used in *CrawlSpider* spiders through a set of *Rule* objects.

You can also use link extractors in regular spiders. For example, you can instantiate *LinkExtractor* into a class variable in your spider, and use it from your spider callbacks:

```
def parse(self, response):
    for link in self.link_extractor.extract_links(response):
        yield Request(link.url, callback=self.parse)
```

3.10.1 Link extractor reference

The link extractor class is *scrapy.linkextractors.lxmlhtml.LxmlLinkExtractor*. For convenience it can also be imported as `scrapy.linkextractors.LinkExtractor`:

```
from scrapy.linkextractors import LinkExtractor
```

LxmlLinkExtractor

class scrapy.linkextractors.lxmlhtml.**LxmlLinkExtractor**(*allow=()*, *deny=()*, *allow_domains=()*, *deny_domains=()*, *deny_extensions=None*, *restrict_xpaths=()*, *restrict_css=()*, *tags=('a', 'area')*, *attrs=('href',)*, *canonicalize=False*, *unique=True*, *process_value=None*, *strip=True*)

LxmlLinkExtractor is the recommended link extractor with handy filtering options. It is implemented using lxml's robust HTMLParser.

Parameters

- **allow** (*str or list*) – a single regular expression (or list of regular expressions) that the (absolute) urls must match in order to be extracted. If not given (or empty), it will match all links.
- **deny** (*str or list*) – a single regular expression (or list of regular expressions) that the (absolute) urls must match in order to be excluded (i.e. not extracted). It has precedence over the `allow` parameter. If not given (or empty) it won't exclude any links.
- **allow_domains** (*str or list*) – a single value or a list of string containing domains which will be considered for extracting the links
- **deny_domains** (*str or list*) – a single value or a list of strings containing domains which won't be considered for extracting the links
- **deny_extensions** (*list*) – a single value or list of strings containing extensions that should be ignored when extracting links. If not given, it will default to `scrapy.linkextractors.IGNORED_EXTENSIONS`.

  Changed in version 2.0: `IGNORED_EXTENSIONS` now includes `7z`, `7zip`, `apk`, `bz2`, `cdr`, `dmg`, `ico`, `iso`, `tar`, `tar.gz`, `webm`, and `xz`.

- **restrict_xpaths** (*str or list*) – is an XPath (or list of XPath's) which defines regions inside the response where links should be extracted from. If given, only the text selected by those XPath will be scanned for links.
- **restrict_css** (*str or list*) – a CSS selector (or list of selectors) which defines regions inside the response where links should be extracted from. Has the same behaviour as `restrict_xpaths`.
- **restrict_text** (*str or list*) – a single regular expression (or list of regular expressions) that the link's text must match in order to be extracted. If not given (or empty), it will match all links. If a list of regular expressions is given, the link will be extracted if it matches at least one.
- **tags** (*str or list*) – a tag or a list of tags to consider when extracting links. Defaults to `('a', 'area')`.
- **attrs** (*list*) – an attribute or list of attributes which should be considered when looking for links to extract (only for those tags specified in the `tags` parameter). Defaults to `('href',)`
- **canonicalize** (*bool*) – canonicalize each extracted url (using w3lib.url.canonicalize_url). Defaults to `False`. Note that canonicalize_url is meant for duplicate checking; it can change the URL visible at server side, so the response can be different for requests with canonicalized and raw URLs. If you're using LinkExtractor to follow links it is more robust to keep the default `canonicalize=False`.
- **unique** (*bool*) – whether duplicate filtering should be applied to extracted links.

- **process_value** (*collections.abc.Callable*) – a function which receives each value extracted from the tag and attributes scanned and can modify the value and return a new one, or return `None` to ignore the link altogether. If not given, `process_value` defaults to `lambda x: x`.

  For example, to extract links from this code:

  ```
  <a href="javascript:goToPage('../other/page.html'); return false">
  ↪Link text</a>
  ```

  You can use the following function in `process_value`:

  ```
  def process_value(value):
      m = re.search(r"javascript:goToPage\('(.*?)'", value)
      if m:
          return m.group(1)
  ```

- **strip** (*bool*) – whether to strip whitespaces from extracted attributes. According to HTML5 standard, leading and trailing whitespaces must be stripped from `href` attributes of `<a>`, `<area>` and many other elements, `src` attribute of `<img>`, `<iframe>` elements, etc., so LinkExtractor strips space chars by default. Set `strip=False` to turn it off (e.g. if you're extracting urls from elements or attributes which allow leading/trailing whitespaces).

extract_links(*response: TextResponse*) → list[*Link*]

Returns a list of *Link* objects from the specified *response*.

Only links that match the settings passed to the `__init__` method of the link extractor are returned.

Duplicate links are omitted if the `unique` attribute is set to `True`, otherwise they are returned.

Link

class scrapy.link.**Link**(*url: str*, *text: str = ''*, *fragment: str = ''*, *nofollow: bool = False*)

Link objects represent an extracted link by the LinkExtractor.

Using the anchor tag sample below to illustrate the parameters:

```
<a href="https://example.com/nofollow.html#foo" rel="nofollow">Dont follow this one
↪</a>
```

Parameters

- **url** – the absolute url being linked to in the anchor tag. From the sample, this is `https://example.com/nofollow.html`.
- **text** – the text in the anchor tag. From the sample, this is `Dont follow this one`.
- **fragment** – the part of the url after the hash symbol. From the sample, this is `foo`.
- **nofollow** – an indication of the presence or absence of a nofollow value in the `rel` attribute of the anchor tag.

3.11 Settings

The Scrapy settings allows you to customize the behaviour of all Scrapy components, including the core, extensions, pipelines and spiders themselves.

The infrastructure of the settings provides a global namespace of key-value mappings that the code can use to pull configuration values from. The settings can be populated through different mechanisms, which are described below.

The settings are also the mechanism for selecting the currently active Scrapy project (in case you have many).

For a list of available built-in settings see: *Built-in settings reference*.

3.11.1 Designating the settings

When you use Scrapy, you have to tell it which settings you're using. You can do this by using an environment variable, `SCRAPY_SETTINGS_MODULE`.

The value of `SCRAPY_SETTINGS_MODULE` should be in Python path syntax, e.g. `myproject.settings`. Note that the settings module should be on the Python import search path.

3.11.2 Populating the settings

Settings can be populated using different mechanisms, each of which has a different precedence:

1. *Command-line settings* (highest precedence)
2. *Spider settings*
3. *Project settings*
4. *Add-on settings*
5. *Command-specific default settings*
6. *Global default settings* (lowest precedence)

1. Command-line settings

Settings set in the command line have the highest precedence, overriding any other settings.

You can explicitly override one or more settings using the `-s` (or `--set`) command-line option.

Example:

```
scrapy crawl myspider -s LOG_LEVEL=INFO -s LOG_FILE=scrapy.log
```

2. Spider settings

Spiders can define their own settings that will take precedence and override the project ones.

> **Note**
>
> *Pre-crawler settings* cannot be defined per spider, and *reactor settings* should not have a different value per spider when *running multiple spiders in the same process*.

One way to do so is by setting their `custom_settings` attribute:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"
```

(continues on next page)

(continued from previous page)

```
    custom_settings = {
        "SOME_SETTING": "some value",
    }
```

It's often better to implement *update_settings()* instead, and settings set there should use the "spider" priority explicitly:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"

    @classmethod
    def update_settings(cls, settings):
        super().update_settings(settings)
        settings.set("SOME_SETTING", "some value", priority="spider")
```

Added in version 2.11.

It's also possible to modify the settings in the *from_crawler()* method, e.g. based on *spider arguments* or other logic:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"

    @classmethod
    def from_crawler(cls, crawler, *args, **kwargs):
        spider = super().from_crawler(crawler, *args, **kwargs)
        if "some_argument" in kwargs:
            spider.settings.set(
                "SOME_SETTING", kwargs["some_argument"], priority="spider"
            )
        return spider
```

3. Project settings

Scrapy projects include a settings module, usually a file called `settings.py`, where you should populate most settings that apply to all your spiders.

See also

Designating the settings

4. Add-on settings

Add-ons can modify settings. They should do this with "addon" priority where possible.

5. Command-specific default settings

Each *Scrapy command* can have its own default settings, which override the *global default settings*.

Those command-specific default settings are specified in the `default_settings` attribute of each command class.

6. Default global settings

The `scrapy.settings.default_settings` module defines global default values for some *built-in settings*.

> **Note**
>
> *`startproject`* generates a `settings.py` file that sets some settings to different values.
>
> The reference documentation of settings indicates the default value if one exists. If *`startproject`* sets a value, that value is documented as default, and the value from `scrapy.settings.default_settings` is documented as "fallback".

3.11.3 Compatibility with pickle

Setting values must be picklable.

3.11.4 Import paths and classes

Added in version 2.4.0.

When a setting references a callable object to be imported by Scrapy, such as a class or a function, there are two different ways you can specify that object:

- As a string containing the import path of that object
- As the object itself

For example:

```
from mybot.pipelines.validate import ValidateMyItem

ITEM_PIPELINES = {
    # passing the classname...
    ValidateMyItem: 300,
    # ...equals passing the class path
    "mybot.pipelines.validate.ValidateMyItem": 300,
}
```

> **Note**
>
> Passing non-callable objects is not supported.

3.11.5 How to access settings

In a spider, settings are available through `self.settings`:

```
class MySpider(scrapy.Spider):
    name = "myspider"
    start_urls = ["http://example.com"]
```

(continues on next page)

(continued from previous page)

```
    def parse(self, response):
        print(f"Existing settings: {self.settings.attributes.keys()}")
```

Note

The `settings` attribute is set in the base Spider class after the spider is initialized. If you want to use settings before the initialization (e.g., in your spider's `__init__()` method), you'll need to override the *`from_crawler()`* method.

Components can also *access settings*.

The `settings` object can be used like a `dict` (e.g. `settings["LOG_ENABLED"]`). However, to support non-string setting values, which may be passed from the command line as strings, it is recommended to use one of the methods provided by the *`Settings`* API.

3.11.6 Component priority dictionaries

A **component priority dictionary** is a `dict` where keys are *components* and values are component priorities. For example:

```
{
    "path.to.ComponentA": None,
    ComponentB: 100,
}
```

A component can be specified either as a class object or through an import path.

Warning

Component priority dictionaries are regular `dict` objects. Be careful not to define the same component more than once, e.g. with different import path strings or defining both an import path and a `type` object.

A priority can be an `int` or `None`.

A component with priority 1 goes *before* a component with priority 2. What going before entails, however, depends on the corresponding setting. For example, in the *`DOWNLOADER_MIDDLEWARES`* setting, components have their *`process_request()`* method executed before that of later components, but have their *`process_response()`* method executed after that of later components.

A component with priority `None` is disabled.

Some component priority dictionaries get merged with some built-in value. For example, *`DOWNLOADER_MIDDLEWARES`* is merged with *`DOWNLOADER_MIDDLEWARES_BASE`*. This is where `None` comes in handy, allowing you to disable a component from the base setting in the regular setting:

```
DOWNLOADER_MIDDLEWARES = {
    "scrapy.downloadermiddlewares.offsite.OffsiteMiddleware": None,
}
```

3.11.7 Special settings

The following settings work slightly differently than all other settings.

Pre-crawler settings

Pre-crawler settings are settings used before the *Crawler* object is created.

These settings cannot be *set from a spider*.

These settings are *SPIDER_LOADER_CLASS* and settings used by the corresponding *component*, e.g. *SPIDER_MODULES* and *SPIDER_LOADER_WARN_ONLY* for the default component.

Reactor settings

Reactor settings are settings tied to the Twisted reactor.

These settings can be defined from a spider. However, because only 1 reactor can be used per process, these settings cannot use a different value per spider when *running multiple spiders in the same process*.

In general, if different spiders define different values, the first defined value is used. However, if two spiders request a different reactor, an exception is raised.

These settings are:

- *ASYNCIO_EVENT_LOOP*
- *DNS_RESOLVER* and settings used by the corresponding component, e.g. *DNSCACHE_ENABLED*, *DNSCACHE_SIZE* and *DNS_TIMEOUT* for the default one.
- *REACTOR_THREADPOOL_MAXSIZE*
- *TWISTED_REACTOR*

ASYNCIO_EVENT_LOOP and *TWISTED_REACTOR* are used upon installing the reactor. The rest of the settings are applied when starting the reactor.

3.11.8 Built-in settings reference

Here's a list of all available Scrapy settings, in alphabetical order, along with their default values and the scope where they apply.

The scope, where available, shows where the setting is being used, if it's tied to any particular component. In that case the module of that component will be shown, typically an extension, middleware or pipeline. It also means that the component must be enabled in order for the setting to have any effect.

ADDONS

Default: `{}`

A dict containing paths to the add-ons enabled in your project and their priorities. For more information, see *Add-ons*.

AWS_ACCESS_KEY_ID

Default: `None`

The AWS access key used by code that requires access to Amazon Web services, such as the *S3 feed storage backend*.

AWS_SECRET_ACCESS_KEY

Default: `None`

The AWS secret key used by code that requires access to Amazon Web services, such as the *S3 feed storage backend*.

AWS_SESSION_TOKEN

Default: `None`

The AWS security token used by code that requires access to Amazon Web services, such as the *S3 feed storage backend*, when using temporary security credentials.

AWS_ENDPOINT_URL

Default: `None`

Endpoint URL used for S3-like storage, for example Minio or s3.scality.

AWS_USE_SSL

Default: `None`

Use this option if you want to disable SSL connection for communication with S3 or S3-like storage. By default SSL will be used.

AWS_VERIFY

Default: `None`

Verify SSL connection between Scrapy and S3 or S3-like storage. By default SSL verification will occur.

AWS_REGION_NAME

Default: `None`

The name of the region associated with the AWS client.

ASYNCIO_EVENT_LOOP

Default: `None`

Import path of a given `asyncio` event loop class.

If the asyncio reactor is enabled (see *TWISTED_REACTOR*) this setting can be used to specify the asyncio event loop to be used with it. Set the setting to the import path of the desired asyncio event loop class. If the setting is set to `None` the default asyncio event loop will be used.

If you are installing the asyncio reactor manually using the *install_reactor()* function, you can use the `event_loop_path` parameter to indicate the import path of the event loop class to be used.

Note that the event loop class must inherit from `asyncio.AbstractEventLoop`.

Caution

Please be aware that, when using a non-default event loop (either defined via *ASYNCIO_EVENT_LOOP* or installed with *install_reactor()*), Scrapy will call `asyncio.set_event_loop()`, which will set the specified event loop as the current loop for the current OS thread.

BOT_NAME

Default: `<project name>` (*fallback*: `'scrapybot'`)

The name of the bot implemented by this Scrapy project (also known as the project name). This name will be used for the logging too.

It's automatically populated with your project name when you create your project with the `startproject` command.

CONCURRENT_ITEMS

Default: `100`

Maximum number of concurrent items (per response) to process in parallel in *item pipelines*.

CONCURRENT_REQUESTS

Default: `16`

The maximum number of concurrent (i.e. simultaneous) requests that will be performed by the Scrapy downloader.

CONCURRENT_REQUESTS_PER_DOMAIN

Default: `8`

The maximum number of concurrent (i.e. simultaneous) requests that will be performed to any single domain.

See also: *AutoThrottle extension* and its `AUTOTHROTTLE_TARGET_CONCURRENCY` option.

CONCURRENT_REQUESTS_PER_IP

Default: `0`

The maximum number of concurrent (i.e. simultaneous) requests that will be performed to any single IP. If non-zero, the `CONCURRENT_REQUESTS_PER_DOMAIN` setting is ignored, and this one is used instead. In other words, concurrency limits will be applied per IP, not per domain.

This setting also affects `DOWNLOAD_DELAY` and *AutoThrottle extension*: if `CONCURRENT_REQUESTS_PER_IP` is non-zero, download delay is enforced per IP, not per domain.

DEFAULT_DROPITEM_LOG_LEVEL

Default: `"WARNING"`

Default log level of messages about dropped items.

When an item is dropped by raising `scrapy.exceptions.DropItem` from the `process_item()` method of an *item pipeline*, a message is logged, and by default its log level is the one configured in this setting.

You may specify this log level as an integer (e.g. `20`), as a log level constant (e.g. `logging.INFO`) or as a string with the name of a log level constant (e.g. `"INFO"`).

When writing an item pipeline, you can force a different log level by setting `scrapy.exceptions.DropItem.log_level` in your `scrapy.exceptions.DropItem` exception. For example:

```
from scrapy.exceptions import DropItem

class MyPipeline:
    def process_item(self, item, spider):
        if not item.get("price"):
```

(continues on next page)

(continued from previous page)

```
            raise DropItem("Missing price data", log_level="INFO")
        return item
```

DEFAULT_ITEM_CLASS

Default: `'scrapy.Item'`

The default class that will be used for instantiating items in the *the Scrapy shell*.

DEFAULT_REQUEST_HEADERS

Default:

```
{
    "Accept": "text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8",
    "Accept-Language": "en",
}
```

The default headers used for Scrapy HTTP Requests. They're populated in the *DefaultHeadersMiddleware*.

Caution

Cookies set via the `Cookie` header are not considered by the *CookiesMiddleware*. If you need to set cookies for a request, use the *Request.cookies* parameter. This is a known current limitation that is being worked on.

DEPTH_LIMIT

Default: `0`

Scope: `scrapy.spidermiddlewares.depth.DepthMiddleware`

The maximum depth that will be allowed to crawl for any site. If zero, no limit will be imposed.

DEPTH_PRIORITY

Default: `0`

Scope: `scrapy.spidermiddlewares.depth.DepthMiddleware`

An integer that is used to adjust the *priority* of a *Request* based on its depth.

The priority of a request is adjusted as follows:

```
request.priority = request.priority - (depth * DEPTH_PRIORITY)
```

As depth increases, positive values of `DEPTH_PRIORITY` decrease request priority (BFO), while negative values increase request priority (DFO). See also *Does Scrapy crawl in breadth-first or depth-first order?*.

Note

This setting adjusts priority **in the opposite way** compared to other priority settings *REDIRECT_PRIORITY_ADJUST* and *RETRY_PRIORITY_ADJUST*.

DEPTH_STATS_VERBOSE

Default: `False`

Scope: `scrapy.spidermiddlewares.depth.DepthMiddleware`

Whether to collect verbose depth stats. If this is enabled, the number of requests for each depth is collected in the stats.

DNSCACHE_ENABLED

Default: `True`

Whether to enable DNS in-memory cache.

DNSCACHE_SIZE

Default: `10000`

DNS in-memory cache size.

DNS_RESOLVER

Added in version 2.0.

Default: `'scrapy.resolver.CachingThreadedResolver'`

The class to be used to resolve DNS names. The default `scrapy.resolver.CachingThreadedResolver` supports specifying a timeout for DNS requests via the *DNS_TIMEOUT* setting, but works only with IPv4 addresses. Scrapy provides an alternative resolver, `scrapy.resolver.CachingHostnameResolver`, which supports IPv4/IPv6 addresses but does not take the *DNS_TIMEOUT* setting into account.

DNS_TIMEOUT

Default: `60`

Timeout for processing of DNS queries in seconds. Float is supported.

DOWNLOADER

Default: `'scrapy.core.downloader.Downloader'`

The downloader to use for crawling.

DOWNLOADER_HTTPCLIENTFACTORY

Default: `'scrapy.core.downloader.webclient.ScrapyHTTPClientFactory'`

Defines a Twisted `protocol.ClientFactory` class to use for HTTP/1.0 connections (for `HTTP10DownloadHandler`).

> **Note**
>
> HTTP/1.0 is rarely used nowadays and its Scrapy support is deprecated, so you can safely ignore this setting, unless you really want to use HTTP/1.0 and override *DOWNLOAD_HANDLERS* for `http(s)` scheme accordingly, i.e. to `'scrapy.core.downloader.handlers.http.HTTP10DownloadHandler'`.

DOWNLOADER_CLIENTCONTEXTFACTORY

Default: `'scrapy.core.downloader.contextfactory.ScrapyClientContextFactory'`

Represents the classpath to the ContextFactory to use.

Here, "ContextFactory" is a Twisted term for SSL/TLS contexts, defining the TLS/SSL protocol version to use, whether to do certificate verification, or even enable client-side authentication (and various other things).

> **Note**
>
> Scrapy default context factory **does NOT perform remote server certificate verification**. This is usually fine for web scraping.
>
> If you do need remote server certificate verification enabled, Scrapy also has another context factory class that you can set, `'scrapy.core.downloader.contextfactory.BrowserLikeContextFactory'`, which uses the platform's certificates to validate remote endpoints.

If you do use a custom ContextFactory, make sure its `__init__` method accepts a `method` parameter (this is the `OpenSSL.SSL` method mapping *DOWNLOADER_CLIENT_TLS_METHOD*), a `tls_verbose_logging` parameter (`bool`) and a `tls_ciphers` parameter (see *DOWNLOADER_CLIENT_TLS_CIPHERS*).

DOWNLOADER_CLIENT_TLS_CIPHERS

Default: `'DEFAULT'`

Use this setting to customize the TLS/SSL ciphers used by the default HTTP/1.1 downloader.

The setting should contain a string in the OpenSSL cipher list format, these ciphers will be used as client ciphers. Changing this setting may be necessary to access certain HTTPS websites: for example, you may need to use `'DEFAULT:!DH'` for a website with weak DH parameters or enable a specific cipher that is not included in `DEFAULT` if a website requires it.

DOWNLOADER_CLIENT_TLS_METHOD

Default: `'TLS'`

Use this setting to customize the TLS/SSL method used by the default HTTP/1.1 downloader.

This setting must be one of these string values:

- `'TLS'`: maps to OpenSSL's `TLS_method()` (a.k.a `SSLv23_method()`), which allows protocol negotiation, starting from the highest supported by the platform; **default, recommended**
- `'TLSv1.0'`: this value forces HTTPS connections to use TLS version 1.0 ; set this if you want the behavior of Scrapy<1.1
- `'TLSv1.1'`: forces TLS version 1.1
- `'TLSv1.2'`: forces TLS version 1.2

DOWNLOADER_CLIENT_TLS_VERBOSE_LOGGING

Default: `False`

Setting this to `True` will enable DEBUG level messages about TLS connection parameters after establishing HTTPS connections. The kind of information logged depends on the versions of OpenSSL and pyOpenSSL.

This setting is only used for the default *DOWNLOADER_CLIENTCONTEXTFACTORY*.

DOWNLOADER_MIDDLEWARES

Default:: {}

A dict containing the downloader middlewares enabled in your project, and their orders. For more info see *Activating a downloader middleware*.

DOWNLOADER_MIDDLEWARES_BASE

Default:

```
{
    "scrapy.downloadermiddlewares.offsite.OffsiteMiddleware": 50,
    "scrapy.downloadermiddlewares.robotstxt.RobotsTxtMiddleware": 100,
    "scrapy.downloadermiddlewares.httpauth.HttpAuthMiddleware": 300,
    "scrapy.downloadermiddlewares.downloadtimeout.DownloadTimeoutMiddleware": 350,
    "scrapy.downloadermiddlewares.defaultheaders.DefaultHeadersMiddleware": 400,
    "scrapy.downloadermiddlewares.useragent.UserAgentMiddleware": 500,
    "scrapy.downloadermiddlewares.retry.RetryMiddleware": 550,
    "scrapy.downloadermiddlewares.ajaxcrawl.AjaxCrawlMiddleware": 560,
    "scrapy.downloadermiddlewares.redirect.MetaRefreshMiddleware": 580,
    "scrapy.downloadermiddlewares.httpcompression.HttpCompressionMiddleware": 590,
    "scrapy.downloadermiddlewares.redirect.RedirectMiddleware": 600,
    "scrapy.downloadermiddlewares.cookies.CookiesMiddleware": 700,
    "scrapy.downloadermiddlewares.httpproxy.HttpProxyMiddleware": 750,
    "scrapy.downloadermiddlewares.stats.DownloaderStats": 850,
    "scrapy.downloadermiddlewares.httpcache.HttpCacheMiddleware": 900,
}
```

A dict containing the downloader middlewares enabled by default in Scrapy. Low orders are closer to the engine, high orders are closer to the downloader. You should never modify this setting in your project, modify *DOWNLOADER_MIDDLEWARES* instead. For more info see *Activating a downloader middleware*.

DOWNLOADER_STATS

Default: `True`

Whether to enable downloader stats collection.

DOWNLOAD_DELAY

Default: `0`

Minimum seconds to wait between 2 consecutive requests to the same domain.

Use *DOWNLOAD_DELAY* to throttle your crawling speed, to avoid hitting servers too hard.

Decimal numbers are supported. For example, to send a maximum of 4 requests every 10 seconds:

```
DOWNLOAD_DELAY = 2.5
```

This setting is also affected by the *RANDOMIZE_DOWNLOAD_DELAY* setting, which is enabled by default.

When *CONCURRENT_REQUESTS_PER_IP* is non-zero, delays are enforced per IP address instead of per domain.

Note that *DOWNLOAD_DELAY* can lower the effective per-domain concurrency below *CONCURRENT_REQUESTS_PER_DOMAIN*. If the response time of a domain is lower than *DOWNLOAD_DELAY*, the effective concurrency for that domain is 1. When testing throttling configurations, it usually makes

sense to lower *CONCURRENT_REQUESTS_PER_DOMAIN* first, and only increase *DOWNLOAD_DELAY* once *CONCURRENT_REQUESTS_PER_DOMAIN* is 1 but a higher throttling is desired.

> **Note**
>
> This delay can be set per spider using `download_delay` spider attribute.

It is also possible to change this setting per domain, although it requires non-trivial code. See the implementation of the *AutoThrottle* extension for an example.

DOWNLOAD_HANDLERS

Default: `{}`

A dict containing the request downloader handlers enabled in your project. See *DOWNLOAD_HANDLERS_BASE* for example format.

DOWNLOAD_HANDLERS_BASE

Default:

```
{
    "data": "scrapy.core.downloader.handlers.datauri.DataURIDownloadHandler",
    "file": "scrapy.core.downloader.handlers.file.FileDownloadHandler",
    "http": "scrapy.core.downloader.handlers.http.HTTPDownloadHandler",
    "https": "scrapy.core.downloader.handlers.http.HTTPDownloadHandler",
    "s3": "scrapy.core.downloader.handlers.s3.S3DownloadHandler",
    "ftp": "scrapy.core.downloader.handlers.ftp.FTPDownloadHandler",
}
```

A dict containing the request download handlers enabled by default in Scrapy. You should never modify this setting in your project, modify *DOWNLOAD_HANDLERS* instead.

You can disable any of these download handlers by assigning `None` to their URI scheme in *DOWNLOAD_HANDLERS*. E.g., to disable the built-in FTP handler (without replacement), place this in your `settings.py`:

```
DOWNLOAD_HANDLERS = {
    "ftp": None,
}
```

The default HTTPS handler uses HTTP/1.1. To use HTTP/2:

1. Install `Twisted[http2]>=17.9.0` to install the packages required to enable HTTP/2 support in Twisted.
2. Update *DOWNLOAD_HANDLERS* as follows:

   ```
   DOWNLOAD_HANDLERS = {
       "https": "scrapy.core.downloader.handlers.http2.H2DownloadHandler",
   }
   ```

> **Warning**
>
> HTTP/2 support in Scrapy is experimental, and not yet recommended for production environments. Future Scrapy versions may introduce related changes without a deprecation period or warning.

Note

Known limitations of the current HTTP/2 implementation of Scrapy include:

- No support for HTTP/2 Cleartext (h2c), since no major browser supports HTTP/2 unencrypted (refer http2 faq).
- No setting to specify a maximum frame size larger than the default value, 16384. Connections to servers that send a larger frame will fail.
- No support for server pushes, which are ignored.
- No support for the *bytes_received* and *headers_received* signals.

DOWNLOAD_SLOTS

Default: `{}`

Allows to define concurrency/delay parameters on per slot (domain) basis:

```
DOWNLOAD_SLOTS = {
    "quotes.toscrape.com": {"concurrency": 1, "delay": 2, "randomize_delay":␣
↪False},
    "books.toscrape.com": {"delay": 3, "randomize_delay": False},
}
```

Note

For other downloader slots default settings values will be used:

- *DOWNLOAD_DELAY*: `delay`
- *CONCURRENT_REQUESTS_PER_DOMAIN*: `concurrency`
- *RANDOMIZE_DOWNLOAD_DELAY*: `randomize_delay`

DOWNLOAD_TIMEOUT

Default: `180`

The amount of time (in secs) that the downloader will wait before timing out.

Note

This timeout can be set per spider using `download_timeout` spider attribute and per-request using *download_timeout* Request.meta key.

DOWNLOAD_MAXSIZE

Default: `1073741824` (1 GiB)

The maximum response body size (in bytes) allowed. Bigger responses are aborted and ignored.

This applies both before and after compression. If decompressing a response body would exceed this limit, decompression is aborted and the response is ignored.

Use `0` to disable this limit.

This limit can be set per spider using the `download_maxsize` spider attribute and per request using the *download_maxsize* Request.meta key.

DOWNLOAD_WARNSIZE

Default: `33554432` (32 MiB)

If the size of a response exceeds this value, before or after compression, a warning will be logged about it.

Use `0` to disable this limit.

This limit can be set per spider using the `download_warnsize` spider attribute and per request using the *download_warnsize* Request.meta key.

DOWNLOAD_FAIL_ON_DATALOSS

Default: `True`

Whether or not to fail on broken responses, that is, declared `Content-Length` does not match content sent by the server or chunked response was not properly finish. If `True`, these responses raise a `ResponseFailed([_DataLoss])` error. If `False`, these responses are passed through and the flag `dataloss` is added to the response, i.e.: `'dataloss' in response.flags` is `True`.

Optionally, this can be set per-request basis by using the *download_fail_on_dataloss* Request.meta key to `False`.

Note

A broken response, or data loss error, may happen under several circumstances, from server misconfiguration to network errors to data corruption. It is up to the user to decide if it makes sense to process broken responses considering they may contain partial or incomplete content. If *RETRY_ENABLED* is `True` and this setting is set to `True`, the `ResponseFailed([_DataLoss])` failure will be retried as usual.

Warning

This setting is ignored by the `H2DownloadHandler` download handler (see *DOWNLOAD_HANDLERS*). In case of a data loss error, the corresponding HTTP/2 connection may be corrupted, affecting other requests that use the same connection; hence, a `ResponseFailed([InvalidBodyLengthError])` failure is always raised for every request that was using that connection.

DUPEFILTER_CLASS

Default: `'scrapy.dupefilters.RFPDupeFilter'`

The class used to detect and filter duplicate requests.

The default, *RFPDupeFilter*, filters based on the *REQUEST_FINGERPRINTER_CLASS* setting.

To change how duplicates are checked, you can point *DUPEFILTER_CLASS* to a custom subclass of *RFPDupeFilter* that overrides its `__init__` method to use a *different request fingerprinting class*. For example:

```
from scrapy.dupefilters import RFPDupeFilter
from scrapy.utils.request import fingerprint
```

(continues on next page)

(continued from previous page)

```
class CustomRequestFingerprinter:
    def fingerprint(self, request):
        return fingerprint(request, include_headers=["X-ID"])

class CustomDupeFilter(RFPDupeFilter):

    def __init__(self, path=None, debug=False, *, fingerprinter=None):
        super().__init__(
            path=path, debug=debug, fingerprinter=CustomRequestFingerprinter()
        )
```

To disable duplicate request filtering set *DUPEFILTER_CLASS* to `'scrapy.dupefilters.BaseDupeFilter'`. Note that not filtering out duplicate requests may cause crawling loops. It is usually better to set the `dont_filter` parameter to `True` on the `__init__` method of a specific *Request* object that should not be filtered out.

A class assigned to *DUPEFILTER_CLASS* must implement the following interface:

```
class MyDupeFilter:

    @classmethod
    def from_settings(cls, settings):
        """Returns an instance of this duplicate request filtering class
        based on the current crawl settings."""
        return cls()

    def request_seen(self, request):
        """Returns ``True`` if *request* is a duplicate of another request
        seen in a previous call to :meth:`request_seen`, or ``False``
        otherwise."""
        return False

    def open(self):
        """Called before the spider opens. It may return a deferred."""
        pass

    def close(self, reason):
        """Called before the spider closes. It may return a deferred."""
        pass

    def log(self, request, spider):
        """Logs that a request has been filtered out.

        It is called right after a call to :meth:`request_seen` that
        returns ``True``.

        If :meth:`request_seen` always returns ``False``, such as in the
        case of :class:`~scrapy.dupefilters.BaseDupeFilter`, this method
        may be omitted.
        """
        pass
```

class scrapy.dupefilters.**BaseDupeFilter**

Dummy duplicate request filtering class (*DUPEFILTER_CLASS*) that does not filter out any request.

class scrapy.dupefilters.**RFPDupeFilter**(*path: str | None = None*, *debug: bool = False*, ***, *fingerprinter: RequestFingerprinterProtocol | None = None*)

Duplicate request filtering class (*DUPEFILTER_CLASS*) that filters out requests with the canonical (`w3lib.url.canonicalize_url()`) `url`, `method` and `body`.

DUPEFILTER_DEBUG

Default: `False`

By default, `RFPDupeFilter` only logs the first duplicate request. Setting *DUPEFILTER_DEBUG* to `True` will make it log all duplicate requests.

EDITOR

Default: `vi` (on Unix systems) or the IDLE editor (on Windows)

The editor to use for editing spiders with the *edit* command. Additionally, if the `EDITOR` environment variable is set, the *edit* command will prefer it over the default setting.

EXTENSIONS

Default:: `{}`

Component priority dictionary of enabled extensions. See *Extensions*.

EXTENSIONS_BASE

Default:

```
{
    "scrapy.extensions.corestats.CoreStats": 0,
    "scrapy.extensions.telnet.TelnetConsole": 0,
    "scrapy.extensions.memusage.MemoryUsage": 0,
    "scrapy.extensions.memdebug.MemoryDebugger": 0,
    "scrapy.extensions.closespider.CloseSpider": 0,
    "scrapy.extensions.feedexport.FeedExporter": 0,
    "scrapy.extensions.logstats.LogStats": 0,
    "scrapy.extensions.spiderstate.SpiderState": 0,
    "scrapy.extensions.throttle.AutoThrottle": 0,
}
```

A dict containing the extensions available by default in Scrapy, and their orders. This setting contains all stable built-in extensions. Keep in mind that some of them need to be enabled through a setting.

For more information See the *extensions user guide* and the *list of available extensions*.

FEED_TEMPDIR

The Feed Temp dir allows you to set a custom folder to save crawler temporary files before uploading with *FTP feed storage* and *Amazon S3*.

FEED_STORAGE_GCS_ACL

The Access Control List (ACL) used when storing items to *Google Cloud Storage*. For more information on how to set this value, please refer to the column *JSON API* in Google Cloud documentation.

FTP_PASSIVE_MODE

Default: `True`

Whether or not to use passive mode when initiating FTP transfers.

FTP_PASSWORD

Default: `"guest"`

The password to use for FTP connections when there is no `"ftp_password"` in `Request` meta.

> **Note**
>
> Paraphrasing RFC 1635, although it is common to use either the password "guest" or one's e-mail address for anonymous FTP, some FTP servers explicitly ask for the user's e-mail address and will not allow login with the "guest" password.

FTP_USER

Default: `"anonymous"`

The username to use for FTP connections when there is no `"ftp_user"` in `Request` meta.

GCS_PROJECT_ID

Default: `None`

The Project ID that will be used when storing data on Google Cloud Storage.

ITEM_PIPELINES

Default: `{}`

A dict containing the item pipelines to use, and their orders. Order values are arbitrary, but it is customary to define them in the 0-1000 range. Lower orders process before higher orders.

Example:

```
ITEM_PIPELINES = {
    "mybot.pipelines.validate.ValidateMyItem": 300,
    "mybot.pipelines.validate.StoreMyItem": 800,
}
```

ITEM_PIPELINES_BASE

Default: `{}`

A dict containing the pipelines enabled by default in Scrapy. You should never modify this setting in your project, modify *ITEM_PIPELINES* instead.

JOBDIR

Default: `None`

A string indicating the directory for storing the state of a crawl when *pausing and resuming crawls*.

LOG_ENABLED

Default: `True`

Whether to enable logging.

LOG_ENCODING

Default: `'utf-8'`

The encoding to use for logging.

LOG_FILE

Default: `None`

File name to use for logging output. If `None`, standard error will be used.

LOG_FILE_APPEND

Default: `True`

If `False`, the log file specified with *LOG_FILE* will be overwritten (discarding the output from previous runs, if any).

LOG_FORMAT

Default: `'%(asctime)s [%(name)s] %(levelname)s:  %(message)s'`

String for formatting log messages. Refer to the Python logging documentation for the whole list of available placeholders.

LOG_DATEFORMAT

Default: `'%Y-%m-%d %H:%M:%S'`

String for formatting date/time, expansion of the `%(asctime)s` placeholder in *LOG_FORMAT*. Refer to the Python datetime documentation for the whole list of available directives.

LOG_FORMATTER

Default: *scrapy.logformatter.LogFormatter*

The class to use for *formatting log messages* for different actions.

LOG_LEVEL

Default: `'DEBUG'`

Minimum level to log. Available levels are: CRITICAL, ERROR, WARNING, INFO, DEBUG. For more info see *Logging*.

LOG_STDOUT

Default: `False`

If `True`, all standard output (and error) of your process will be redirected to the log. For example if you `print('hello')` it will appear in the Scrapy log.

LOG_SHORT_NAMES

Default: `False`

If `True`, the logs will just contain the root path. If it is set to `False` then it displays the component responsible for the log output

LOG_VERSIONS

Default: `["lxml", "libxml2", "cssselect", "parsel", "w3lib", "Twisted", "Python", "pyOpenSSL", "cryptography", "Platform"]`

Logs the installed versions of the specified items.

An item can be any installed Python package.

The following special items are also supported:

- `libxml2`
- `Platform` (`platform.platform()`)
- `Python`

LOGSTATS_INTERVAL

Default: `60.0`

The interval (in seconds) between each logging printout of the stats by *LogStats*.

MEMDEBUG_ENABLED

Default: `False`

Whether to enable memory debugging.

MEMDEBUG_NOTIFY

Default: `[]`

When memory debugging is enabled a memory report will be sent to the specified addresses if this setting is not empty, otherwise the report will be written to the log.

Example:

```
MEMDEBUG_NOTIFY = ['user@example.com']
```

MEMUSAGE_ENABLED

Default: `True`

Scope: `scrapy.extensions.memusage`

Whether to enable the memory usage extension. This extension keeps track of a peak memory used by the process (it writes it to stats). It can also optionally shutdown the Scrapy process when it exceeds a memory limit (see *MEMUSAGE_LIMIT_MB*), and notify by email when that happened (see *MEMUSAGE_NOTIFY_MAIL*).

See *Memory usage extension*.

MEMUSAGE_LIMIT_MB

Default: `0`

Scope: `scrapy.extensions.memusage`

The maximum amount of memory to allow (in megabytes) before shutting down Scrapy (if MEMUSAGE_ENABLED is True). If zero, no check will be performed.

See *Memory usage extension*.

MEMUSAGE_CHECK_INTERVAL_SECONDS

Default: `60.0`

Scope: `scrapy.extensions.memusage`

The *Memory usage extension* checks the current memory usage, versus the limits set by *MEMUSAGE_LIMIT_MB* and *MEMUSAGE_WARNING_MB*, at fixed time intervals.

This sets the length of these intervals, in seconds.

See *Memory usage extension*.

MEMUSAGE_NOTIFY_MAIL

Default: `False`

Scope: `scrapy.extensions.memusage`

A list of emails to notify if the memory limit has been reached.

Example:

```
MEMUSAGE_NOTIFY_MAIL = ['user@example.com']
```

See *Memory usage extension*.

MEMUSAGE_WARNING_MB

Default: `0`

Scope: `scrapy.extensions.memusage`

The maximum amount of memory to allow (in megabytes) before sending a warning email notifying about it. If zero, no warning will be produced.

NEWSPIDER_MODULE

Default: `"<project name>.spiders"` (*fallback*: `""`)

Module where to create new spiders using the *genspider* command.

Example:

```
NEWSPIDER_MODULE = 'mybot.spiders_dev'
```

RANDOMIZE_DOWNLOAD_DELAY

Default: `True`

If enabled, Scrapy will wait a random amount of time (between 0.5 * *DOWNLOAD_DELAY* and 1.5 * *DOWNLOAD_DELAY*) while fetching requests from the same website.

This randomization decreases the chance of the crawler being detected (and subsequently blocked) by sites which analyze requests looking for statistically significant similarities in the time between their requests.

The randomization policy is the same used by wget `--random-wait` option.

If *DOWNLOAD_DELAY* is zero (default) this option has no effect.

REACTOR_THREADPOOL_MAXSIZE

Default: `10`

The maximum limit for Twisted Reactor thread pool size. This is common multi-purpose thread pool used by various Scrapy components. Threaded DNS Resolver, BlockingFeedStorage, S3FilesStore just to name a few. Increase this value if you're experiencing problems with insufficient blocking IO.

REDIRECT_PRIORITY_ADJUST

Default: `+2`

Scope: `scrapy.downloadermiddlewares.redirect.RedirectMiddleware`

Adjust redirect request priority relative to original request:

- **a positive priority adjust (default) means higher priority.**
- a negative priority adjust means lower priority.

ROBOTSTXT_OBEY

Default: `True` (*fallback*: `False`)

If enabled, Scrapy will respect robots.txt policies. For more information see *RobotsTxtMiddleware*.

> **Note**
>
> While the default value is `False` for historical reasons, this option is enabled by default in settings.py file generated by `scrapy startproject` command.

ROBOTSTXT_PARSER

Default: `'scrapy.robotstxt.ProtegoRobotParser'`

The parser backend to use for parsing `robots.txt` files. For more information see *RobotsTxtMiddleware*.

ROBOTSTXT_USER_AGENT

Default: `None`

The user agent string to use for matching in the robots.txt file. If `None`, the User-Agent header you are sending with the request or the *USER_AGENT* setting (in that order) will be used for determining the user agent to use in the robots.txt file.

SCHEDULER

Default: `'scrapy.core.scheduler.Scheduler'`

The scheduler class to be used for crawling. See the *Scheduler* topic for details.

SCHEDULER_DEBUG

Default: `False`

Setting to `True` will log debug information about the requests scheduler. This currently logs (only once) if the requests cannot be serialized to disk. Stats counter (`scheduler/unserializable`) tracks the number of times this happens.

Example entry in logs:

```
1956-01-31 00:00:00+0800 [scrapy.core.scheduler] ERROR: Unable to serialize request:
<GET http://example.com> - reason: cannot serialize <Request at 0x9a7c7ec>
(type Request)> - no more unserializable requests will be logged
(see 'scheduler/unserializable' stats counter)
```

SCHEDULER_DISK_QUEUE

Default: `'scrapy.squeues.PickleLifoDiskQueue'`

Type of disk queue that will be used by the scheduler. Other available types are `scrapy.squeues.PickleFifoDiskQueue`, `scrapy.squeues.MarshalFifoDiskQueue`, `scrapy.squeues.MarshalLifoDiskQueue`.

SCHEDULER_MEMORY_QUEUE

Default: `'scrapy.squeues.LifoMemoryQueue'`

Type of in-memory queue used by the scheduler. Other available type is: `scrapy.squeues.FifoMemoryQueue`.

SCHEDULER_PRIORITY_QUEUE

Default: `'scrapy.pqueues.ScrapyPriorityQueue'`

Type of priority queue used by the scheduler. Another available type is `scrapy.pqueues.DownloaderAwarePriorityQueue`. `scrapy.pqueues.DownloaderAwarePriorityQueue` works better than `scrapy.pqueues.ScrapyPriorityQueue` when you crawl many different domains in parallel. But currently `scrapy.pqueues.DownloaderAwarePriorityQueue` does not work together with *CONCURRENT_REQUESTS_PER_IP*.

SCHEDULER_START_DISK_QUEUE

Default: `'scrapy.squeues.PickleFifoDiskQueue'`

Type of disk queue (see *JOBDIR*) that the *scheduler* uses for *start requests*.

For available choices, see *SCHEDULER_DISK_QUEUE*.

Use `None` or `""` to disable these separate queues entirely, and instead have start requests share the same queues as other requests.

Note

Disabling separate start request queues makes *start request order* unintuitive: start requests will be sent in order only until *CONCURRENT_REQUESTS* is reached, then remaining start requests will be sent in reverse order.

SCHEDULER_START_MEMORY_QUEUE

Default: `'scrapy.squeues.FifoMemoryQueue'`

Type of in-memory queue that the *scheduler* uses for *start requests*.

For available choices, see *SCHEDULER_MEMORY_QUEUE*.

Use `None` or `""` to disable these separate queues entirely, and instead have start requests share the same queues as other requests.

> **Note**
>
> Disabling separate start request queues makes *start request order* unintuitive: start requests will be sent in order only until *CONCURRENT_REQUESTS* is reached, then remaining start requests will be sent in reverse order.

SCRAPER_SLOT_MAX_ACTIVE_SIZE

Added in version 2.0.

Default: `5_000_000`

Soft limit (in bytes) for response data being processed.

While the sum of the sizes of all responses being processed is above this value, Scrapy does not process new requests.

SPIDER_CONTRACTS

Default:: `{}`

A dict containing the spider contracts enabled in your project, used for testing spiders. For more info see *Spiders Contracts*.

SPIDER_CONTRACTS_BASE

Default:

```
{
    "scrapy.contracts.default.UrlContract": 1,
    "scrapy.contracts.default.ReturnsContract": 2,
    "scrapy.contracts.default.ScrapesContract": 3,
}
```

A dict containing the Scrapy contracts enabled by default in Scrapy. You should never modify this setting in your project, modify *SPIDER_CONTRACTS* instead. For more info see *Spiders Contracts*.

You can disable any of these contracts by assigning `None` to their class path in *SPIDER_CONTRACTS*. E.g., to disable the built-in `ScrapesContract`, place this in your `settings.py`:

```
SPIDER_CONTRACTS = {
    "scrapy.contracts.default.ScrapesContract": None,
}
```

SPIDER_LOADER_CLASS

Default: `'scrapy.spiderloader.SpiderLoader'`

The class that will be used for loading spiders, which must implement the *SpiderLoader API*.

SPIDER_LOADER_WARN_ONLY

Default: `False`

By default, when Scrapy tries to import spider classes from *SPIDER_MODULES*, it will fail loudly if there is any `ImportError` or `SyntaxError` exception. But you can choose to silence this exception and turn it into a simple warning by setting `SPIDER_LOADER_WARN_ONLY = True`.

Note

Some *scrapy commands* run with this setting to `True` already (i.e. they will only issue a warning and will not fail) since they do not actually need to load spider classes to work: *scrapy runspider*, *scrapy settings*, *scrapy startproject*, *scrapy version*.

SPIDER_MIDDLEWARES

Default:: `{}`

A dict containing the spider middlewares enabled in your project, and their orders. For more info see *Activating a spider middleware*.

SPIDER_MIDDLEWARES_BASE

Default:

```
{
    "scrapy.spidermiddlewares.httperror.HttpErrorMiddleware": 50,
    "scrapy.spidermiddlewares.referer.RefererMiddleware": 700,
    "scrapy.spidermiddlewares.urllength.UrlLengthMiddleware": 800,
    "scrapy.spidermiddlewares.depth.DepthMiddleware": 900,
}
```

A dict containing the spider middlewares enabled by default in Scrapy, and their orders. Low orders are closer to the engine, high orders are closer to the spider. For more info see *Activating a spider middleware*.

SPIDER_MODULES

Default: `["<project name>.spiders"]` (*fallback*: `[]`)

A list of modules where Scrapy will look for spiders.

Example:

```
SPIDER_MODULES = ["mybot.spiders_prod", "mybot.spiders_dev"]
```

STATS_CLASS

Default: `'scrapy.statscollectors.MemoryStatsCollector'`

The class to use for collecting stats, who must implement the *Stats Collector API*.

STATS_DUMP

Default: `True`

Dump the *Scrapy stats* (to the Scrapy log) once the spider finishes.

For more info see: *Stats Collection*.

STATSMAILER_RCPTS

Default: `[]` (empty list)

Send Scrapy stats after spiders finish scraping. See `StatsMailer` for more info.

TELNETCONSOLE_ENABLED

Default: `True`

A boolean which specifies if the *telnet console* will be enabled (provided its extension is also enabled).

TEMPLATES_DIR

Default: `templates` dir inside scrapy module

The directory where to look for templates when creating new projects with `startproject` command and new spiders with `genspider` command.

The project name must not conflict with the name of custom files or directories in the `project` subdirectory.

TWISTED_REACTOR

Added in version 2.0.

Default: `"twisted.internet.asyncioreactor.AsyncioSelectorReactor"`

Import path of a given `reactor`.

Scrapy will install this reactor if no other reactor is installed yet, such as when the `scrapy` CLI program is invoked or when using the `CrawlerProcess` class.

If you are using the `CrawlerRunner` class, you also need to install the correct reactor manually. You can do that using `install_reactor()`:

`scrapy.utils.reactor.`**`install_reactor`**(*reactor_path: str*, *event_loop_path: str | None = None*) → None

Installs the `reactor` with the specified import path. Also installs the asyncio event loop with the specified import path if the asyncio reactor is enabled

If a reactor is already installed, `install_reactor()` has no effect.

`CrawlerRunner.__init__` raises `Exception` if the installed reactor does not match the `TWISTED_REACTOR` setting; therefore, having top-level `reactor` imports in project files and imported third-party libraries will make Scrapy raise `Exception` when it checks which reactor is installed.

In order to use the reactor installed by Scrapy:

```
import scrapy
from twisted.internet import reactor

class QuotesSpider(scrapy.Spider):
    name = "quotes"
```

(continues on next page)

(continued from previous page)

```
    def __init__(self, *args, **kwargs):
        self.timeout = int(kwargs.pop("timeout", "60"))
        super(QuotesSpider, self).__init__(*args, **kwargs)

    async def start(self):
        reactor.callLater(self.timeout, self.stop)

        urls = ["https://quotes.toscrape.com/page/1"]
        for url in urls:
            yield scrapy.Request(url=url, callback=self.parse)

    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {"text": quote.css("span.text::text").get()}

    def stop(self):
        self.crawler.engine.close_spider(self, "timeout")
```

which raises `Exception`, becomes:

```
import scrapy

class QuotesSpider(scrapy.Spider):
    name = "quotes"

    def __init__(self, *args, **kwargs):
        self.timeout = int(kwargs.pop("timeout", "60"))
        super(QuotesSpider, self).__init__(*args, **kwargs)

    async def start(self):
        from twisted.internet import reactor

        reactor.callLater(self.timeout, self.stop)

        urls = ["https://quotes.toscrape.com/page/1"]
        for url in urls:
            yield scrapy.Request(url=url, callback=self.parse)

    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {"text": quote.css("span.text::text").get()}

    def stop(self):
        self.crawler.engine.close_spider(self, "timeout")
```

If this setting is set `None`, Scrapy will use the existing reactor if one is already installed, or install the default reactor defined by Twisted for the current platform.

Changed in version 2.7: The *startproject* command now sets this setting to `twisted.internet.asyncioreactor.AsyncioSelectorReactor` in the generated `settings.py` file.

Changed in version 2.13: The default value was changed from `None` to `"twisted.internet.asyncioreactor.AsyncioSelectorReactor"`.

For additional information, see Choosing a Reactor and GUI Toolkit Integration.

URLLENGTH_LIMIT

Default: `2083`

Scope: `spidermiddlewares.urllength`

The maximum URL length to allow for crawled URLs.

This setting can act as a stopping condition in case of URLs of ever-increasing length, which may be caused for example by a programming error either in the target server or in your code. See also *REDIRECT_MAX_TIMES* and *DEPTH_LIMIT*.

Use `0` to allow URLs of any length.

The default value is copied from the Microsoft Internet Explorer maximum URL length, even though this setting exists for different reasons.

USER_AGENT

Default: `"Scrapy/VERSION (+https://scrapy.org)"`

The default User-Agent to use when crawling, unless overridden. This user agent is also used by *RobotsTxtMiddleware* if *ROBOTSTXT_USER_AGENT* setting is `None` and there is no overriding User-Agent header specified for the request.

WARN_ON_GENERATOR_RETURN_VALUE

Default: `True`

When enabled, Scrapy will warn if generator-based callback methods (like `parse`) contain return statements with non-`None` values. This helps detect potential mistakes in spider development.

Disable this setting to prevent syntax errors that may occur when dynamically modifying generator function source code during runtime, skip AST parsing of callback functions, or improve performance in auto-reloading development environments.

Settings documented elsewhere:

3.12 Exceptions

3.12.1 Built-in Exceptions reference

Here's a list of all exceptions included in Scrapy and their usage.

CloseSpider

exception scrapy.exceptions.**CloseSpider**(*reason='cancelled'*)

This exception can be raised from a spider callback to request the spider to be closed/stopped. Supported arguments:

Parameters
reason (*str*) – the reason for closing

For example:

```
def parse_page(self, response):
    if "Bandwidth exceeded" in response.body:
        raise CloseSpider("bandwidth_exceeded")
```

DontCloseSpider

exception scrapy.exceptions.**DontCloseSpider**

This exception can be raised in a *spider_idle* signal handler to prevent the spider from being closed.

DropItem

exception scrapy.exceptions.**DropItem**

The exception that must be raised by item pipeline stages to stop processing an Item. For more information see *Item Pipeline*.

IgnoreRequest

exception scrapy.exceptions.**IgnoreRequest**

This exception can be raised by the Scheduler or any downloader middleware to indicate that the request should be ignored.

NotConfigured

exception scrapy.exceptions.**NotConfigured**

This exception can be raised by some components to indicate that they will remain disabled. Those components include:

- Extensions
- Item pipelines
- Downloader middlewares
- Spider middlewares

The exception must be raised in the component's `__init__` method.

NotSupported

exception scrapy.exceptions.**NotSupported**

This exception is raised to indicate an unsupported feature.

StopDownload

Added in version 2.2.

exception scrapy.exceptions.**StopDownload**(*fail=True*)

Raised from a *bytes_received* or *headers_received* signal handler to indicate that no further bytes should be downloaded for a response.

The `fail` boolean parameter controls which method will handle the resulting response:

- If `fail=True` (default), the request errback is called. The response object is available as the `response` attribute of the `StopDownload` exception, which is in turn stored as the `value` attribute of the received `Failure` object. This means that in an errback defined as `def errback(self, failure)`, the response can be accessed though `failure.value.response`.
- If `fail=False`, the request callback is called instead.

In both cases, the response could have its body truncated: the body contains all bytes received up until the exception is raised, including the bytes received in the signal handler that raises the exception. Also, the response object is marked with `"download_stopped"` in its *flags* attribute.

> **Note**
>
> `fail` is a keyword-only parameter, i.e. raising `StopDownload(False)` or `StopDownload(True)` will raise a `TypeError`.

See the documentation for the *bytes_received* and *headers_received* signals and the *Stopping the download of a Response* topic for additional information and examples.

CHAPTER

FOUR

BUILT-IN SERVICES

4.1 Logging

Note

`scrapy.log` has been deprecated alongside its functions in favor of explicit calls to the Python standard logging. Keep reading to learn more about the new logging system.

Scrapy uses `logging` for event logging. We'll provide some simple examples to get you started, but for more advanced use-cases it's strongly suggested to read thoroughly its documentation.

Logging works out of the box, and can be configured to some extent with the Scrapy settings listed in *Logging settings*.

Scrapy calls *`scrapy.utils.log.configure_logging()`* to set some reasonable defaults and handle those settings in *Logging settings* when running commands, so it's recommended to manually call it if you're running Scrapy from scripts as described in *Run Scrapy from a script*.

4.1.1 Log levels

Python's builtin logging defines 5 different levels to indicate the severity of a given log message. Here are the standard ones, listed in decreasing order:

1. `logging.CRITICAL` - for critical errors (highest severity)
2. `logging.ERROR` - for regular errors
3. `logging.WARNING` - for warning messages
4. `logging.INFO` - for informational messages
5. `logging.DEBUG` - for debugging messages (lowest severity)

4.1.2 How to log messages

Here's a quick example of how to log a message using the `logging.WARNING` level:

```
import logging

logging.warning("This is a warning")
```

There are shortcuts for issuing log messages on any of the standard 5 levels, and there's also a general `logging.log` method which takes a given level as argument. If needed, the last example could be rewritten as:

```
import logging

logging.log(logging.WARNING, "This is a warning")
```

On top of that, you can create different "loggers" to encapsulate messages. (For example, a common practice is to create different loggers for every module). These loggers can be configured independently, and they allow hierarchical constructions.

The previous examples use the root logger behind the scenes, which is a top level logger where all messages are propagated to (unless otherwise specified). Using `logging` helpers is merely a shortcut for getting the root logger explicitly, so this is also an equivalent of the last snippets:

```
import logging

logger = logging.getLogger()
logger.warning("This is a warning")
```

You can use a different logger just by getting its name with the `logging.getLogger` function:

```
import logging

logger = logging.getLogger("mycustomlogger")
logger.warning("This is a warning")
```

Finally, you can ensure having a custom logger for any module you're working on by using the `__name__` variable, which is populated with current module's path:

```
import logging

logger = logging.getLogger(__name__)
logger.warning("This is a warning")
```

Module logging, HowTo
Basic Logging Tutorial

Module logging, Loggers
Further documentation on loggers

4.1.3 Logging from Spiders

Scrapy provides a *logger* within each Spider instance, which can be accessed and used like this:

```
import scrapy

class MySpider(scrapy.Spider):
    name = "myspider"
    start_urls = ["https://scrapy.org"]

    def parse(self, response):
        self.logger.info("Parse function called on %s", response.url)
```

That logger is created using the Spider's name, but you can use any custom Python logger you want. For example:

```
import logging
import scrapy

logger = logging.getLogger("mycustomlogger")

class MySpider(scrapy.Spider):
    name = "myspider"
    start_urls = ["https://scrapy.org"]

    def parse(self, response):
        logger.info("Parse function called on %s", response.url)
```

4.1.4 Logging configuration

Loggers on their own don't manage how messages sent through them are displayed. For this task, different "handlers" can be attached to any logger instance and they will redirect those messages to appropriate destinations, such as the standard output, files, emails, etc.

By default, Scrapy sets and configures a handler for the root logger, based on the settings below.

Logging settings

These settings can be used to configure the logging:

- *LOG_FILE*
- *LOG_FILE_APPEND*
- *LOG_ENABLED*
- *LOG_ENCODING*
- *LOG_LEVEL*
- *LOG_FORMAT*
- *LOG_DATEFORMAT*
- *LOG_STDOUT*
- *LOG_SHORT_NAMES*

The first couple of settings define a destination for log messages. If *LOG_FILE* is set, messages sent through the root logger will be redirected to a file named *LOG_FILE* with encoding *LOG_ENCODING*. If unset and *LOG_ENABLED* is `True`, log messages will be displayed on the standard error. If *LOG_FILE* is set and *LOG_FILE_APPEND* is `False`, the file will be overwritten (discarding the output from previous runs, if any). Lastly, if *LOG_ENABLED* is `False`, there won't be any visible log output.

LOG_LEVEL determines the minimum level of severity to display, those messages with lower severity will be filtered out. It ranges through the possible levels listed in *Log levels*.

LOG_FORMAT and *LOG_DATEFORMAT* specify formatting strings used as layouts for all messages. Those strings can contain any placeholders listed in logging's logrecord attributes docs and datetime's strftime and strptime directives respectively.

If *LOG_SHORT_NAMES* is set, then the logs will not display the Scrapy component that prints the log. It is unset by default, hence logs contain the Scrapy component responsible for that log output.

Command-line options

There are command-line arguments, available for all commands, that you can use to override some of the Scrapy settings regarding logging.

- **--logfile FILE**
  Overrides *LOG_FILE*
- **--loglevel/-L LEVEL**
  Overrides *LOG_LEVEL*
- **--nolog**
  Sets *LOG_ENABLED* to `False`

See also

Module `logging.handlers`
Further documentation on available handlers

Custom Log Formats

A custom log format can be set for different actions by extending *LogFormatter* class and making *LOG_FORMATTER* point to your new class.

class `scrapy.logformatter.`**LogFormatter**

Class for generating log messages for different actions.

All methods must return a dictionary listing the parameters `level`, `msg` and `args` which are going to be used for constructing the log message when calling `logging.log`.

Dictionary keys for the method outputs:

- `level` is the log level for that action, you can use those from the python logging library : `logging.DEBUG`, `logging.INFO`, `logging.WARNING`, `logging.ERROR` and `logging.CRITICAL`.
- `msg` should be a string that can contain different formatting placeholders. This string, formatted with the provided `args`, is going to be the long message for that action.
- `args` should be a tuple or dict with the formatting placeholders for `msg`. The final log message is computed as `msg % args`.

Users can define their own `LogFormatter` class if they want to customize how each action is logged or if they want to omit it entirely. In order to omit logging an action the method must return `None`.

Here is an example on how to create a custom log formatter to lower the severity level of the log message when an item is dropped from the pipeline:

```
class PoliteLogFormatter(logformatter.LogFormatter):
    def dropped(self, item, exception, response, spider):
        return {
            'level': logging.INFO, # lowering the level from logging.WARNING
            'msg': "Dropped: %(exception)s" + os.linesep + "%(item)s",
            'args': {
                'exception': exception,
                'item': item,
            }
        }
```

crawled(*request:* Request, *response:* Response, *spider:* Spider) → LogFormatterResult

Logs a message when the crawler finds a webpage.

download_error(*failure:* *Failure*, *request:* Request, *spider:* Spider, *errmsg:* *str* | *None* = *None*) → LogFormatterResult

Logs a download error message from a spider (typically coming from the engine).

Added in version 2.0.

dropped(*item:* *Any*, *exception:* *BaseException*, *response:* Response | *Failure* | *None*, *spider:* Spider) → LogFormatterResult

Logs a message when an item is dropped while it is passing through the item pipeline.

item_error(*item:* *Any*, *exception:* *BaseException*, *response:* Response | *Failure* | *None*, *spider:* Spider) → LogFormatterResult

Logs a message when an item causes an error while it is passing through the item pipeline.

Added in version 2.0.

scraped(*item:* *Any*, *response:* Response | *Failure* | *None*, *spider:* Spider) → LogFormatterResult

Logs a message when an item is scraped by a spider.

spider_error(*failure:* *Failure*, *request:* Request, *response:* Response | *Failure*, *spider:* Spider) → LogFormatterResult

Logs an error message from a spider.

Added in version 2.0.

Advanced customization

Because Scrapy uses stdlib logging module, you can customize logging using all features of stdlib logging.

For example, let's say you're scraping a website which returns many HTTP 404 and 500 responses, and you want to hide all messages like this:

```
2016-12-16 22:00:06 [scrapy.spidermiddlewares.httperror] INFO: Ignoring
response <500 https://quotes.toscrape.com/page/1-34/>: HTTP status code
is not handled or not allowed
```

The first thing to note is a logger name - it is in brackets: `[scrapy.spidermiddlewares.httperror]`. If you get just `[scrapy]` then *LOG_SHORT_NAMES* is likely set to True; set it to False and re-run the crawl.

Next, we can see that the message has INFO level. To hide it we should set logging level for `scrapy.spidermiddlewares.httperror` higher than INFO; next level after INFO is WARNING. It could be done e.g. in the spider's `__init__` method:

```
import logging
import scrapy

class MySpider(scrapy.Spider):
    # ...
    def __init__(self, *args, **kwargs):
        logger = logging.getLogger("scrapy.spidermiddlewares.httperror")
        logger.setLevel(logging.WARNING)
        super().__init__(*args, **kwargs)
```

If you run this spider again then INFO messages from `scrapy.spidermiddlewares.httperror` logger will be gone.

You can also filter log records by `LogRecord` data. For example, you can filter log records by message content using a substring or a regular expression. Create a `logging.Filter` subclass and equip it with a regular expression pattern to filter out unwanted messages:

```
import logging
import re

class ContentFilter(logging.Filter):
    def filter(self, record):
        match = re.search(r"\d{3} [Ee]rror, retrying", record.message)
        if match:
            return False
```

A project-level filter may be attached to the root handler created by Scrapy, this is a wieldy way to filter all loggers in different parts of the project (middlewares, spider, etc.):

```
import logging
import scrapy

class MySpider(scrapy.Spider):
    # ...
    def __init__(self, *args, **kwargs):
        for handler in logging.root.handlers:
            handler.addFilter(ContentFilter())
```

Alternatively, you may choose a specific logger and hide it without affecting other loggers:

```
import logging
import scrapy

class MySpider(scrapy.Spider):
    # ...
    def __init__(self, *args, **kwargs):
        logger = logging.getLogger("my_logger")
        logger.addFilter(ContentFilter())
```

4.1.5 scrapy.utils.log module

scrapy.utils.log.**configure_logging**(*settings:* Settings | *dict[bool | float | int | str | None, Any]* | *None* = *None*, *install_root_handler:* *bool* = *True*) → None

Initialize logging defaults for Scrapy.

Parameters

- **settings** (dict, *Settings* object or None) – settings used to create and configure a handler for the root logger (default: None).
- **install_root_handler** (*bool*) – whether to install root logging handler (default: True)

This function does:

- Route warnings and twisted logging through Python standard logging

- Assign DEBUG and ERROR level to Scrapy and Twisted loggers respectively
- Route stdout to log if LOG_STDOUT setting is True

When `install_root_handler` is True (default), this function also creates a handler for the root logger according to given settings (see *Logging settings*). You can override default options using `settings` argument. When `settings` is empty or None, defaults are used.

`configure_logging` is automatically called when using Scrapy commands or `CrawlerProcess`, but needs to be called explicitly when running custom scripts using `CrawlerRunner`. In that case, its usage is not required but it's recommended.

Another option when running custom scripts is to manually configure the logging. To do this you can use `logging.basicConfig()` to set a basic root handler.

Note that `CrawlerProcess` automatically calls `configure_logging`, so it is recommended to only use `logging.basicConfig()` together with `CrawlerRunner`.

This is an example on how to redirect `INFO` or higher messages to a file:

```
import logging

logging.basicConfig(
    filename="log.txt", format="%(levelname)s: %(message)s", level=logging.INFO
)
```

Refer to *Run Scrapy from a script* for more details about using Scrapy this way.

4.2 Stats Collection

Scrapy provides a convenient facility for collecting stats in the form of key/values, where values are often counters. The facility is called the Stats Collector, and can be accessed through the `stats` attribute of the *Crawler API*, as illustrated by the examples in the *Common Stats Collector uses* section below.

However, the Stats Collector is always available, so you can always import it in your module and use its API (to increment or set new stat keys), regardless of whether the stats collection is enabled or not. If it's disabled, the API will still work but it won't collect anything. This is aimed at simplifying the stats collector usage: you should spend no more than one line of code for collecting stats in your spider, Scrapy extension, or whatever code you're using the Stats Collector from.

Another feature of the Stats Collector is that it's very efficient (when enabled) and extremely efficient (almost unnoticeable) when disabled.

The Stats Collector keeps a stats table per open spider which is automatically opened when the spider is opened, and closed when the spider is closed.

4.2.1 Common Stats Collector uses

Access the stats collector through the `stats` attribute. Here is an example of an extension that access stats:

```
class ExtensionThatAccessStats:
    def __init__(self, stats):
        self.stats = stats

    @classmethod
    def from_crawler(cls, crawler):
        return cls(crawler.stats)
```

Set stat value:

```
stats.set_value("hostname", socket.gethostname())
```

Increment stat value:

```
stats.inc_value("custom_count")
```

Set stat value only if greater than previous:

```
stats.max_value("max_items_scraped", value)
```

Set stat value only if lower than previous:

```
stats.min_value("min_free_memory_percent", value)
```

Get stat value:

```
>>> stats.get_value("custom_count")
1
```

Get all stats:

```
>>> stats.get_stats()
{'custom_count': 1, 'start_time': datetime.datetime(2009, 7, 14, 21, 47, 28, 977139)}
```

4.2.2 Available Stats Collectors

Besides the basic `StatsCollector` there are other Stats Collectors available in Scrapy which extend the basic Stats Collector. You can select which Stats Collector to use through the *STATS_CLASS* setting. The default Stats Collector used is the `MemoryStatsCollector`.

MemoryStatsCollector

class scrapy.statscollectors.**MemoryStatsCollector**

A simple stats collector that keeps the stats of the last scraping run (for each spider) in memory, after they're closed. The stats can be accessed through the *spider_stats* attribute, which is a dict keyed by spider domain name.

This is the default Stats Collector used in Scrapy.

spider_stats

A dict of dicts (keyed by spider name) containing the stats of the last scraping run for each spider.

DummyStatsCollector

class scrapy.statscollectors.**DummyStatsCollector**

A Stats collector which does nothing but is very efficient (because it does nothing). This stats collector can be set via the *STATS_CLASS* setting, to disable stats collect in order to improve performance. However, the performance penalty of stats collection is usually marginal compared to other Scrapy workload like parsing pages.

4.3 Sending e-mail

Although Python makes sending e-mails relatively easy via the `smtplib` library, Scrapy provides its own facility for sending e-mails which is very easy to use and it's implemented using Twisted non-blocking IO, to avoid interfering

with the non-blocking IO of the crawler. It also provides a simple API for sending attachments and it's very easy to configure, with a few *settings*.

4.3.1 Quick example

There are two ways to instantiate the mail sender. You can instantiate it using the standard `__init__` method:

```
from scrapy.mail import MailSender

mailer = MailSender()
```

Or you can instantiate it passing a `scrapy.Crawler` instance, which will respect the *settings*:

```
mailer = MailSender.from_crawler(crawler)
```

And here is how to use it to send an e-mail (without attachments):

```
mailer.send(
    to=["someone@example.com"],
    subject="Some subject",
    body="Some body",
    cc=["another@example.com"],
)
```

4.3.2 MailSender class reference

The MailSender *components* is the preferred class to use for sending emails from Scrapy, as it uses Twisted non-blocking IO, like the rest of the framework.

class scrapy.mail.**MailSender**(*smtphost=None*, *mailfrom=None*, *smtpuser=None*, *smtppass=None*, *smtpport=None*)

Parameters

- **smtphost** (*str or bytes*) – the SMTP host to use for sending the emails. If omitted, the *MAIL_HOST* setting will be used.
- **mailfrom** (*str*) – the address used to send emails (in the `From:` header). If omitted, the *MAIL_FROM* setting will be used.
- **smtpuser** – the SMTP user. If omitted, the *MAIL_USER* setting will be used. If not given, no SMTP authentication will be performed.
- **smtppass** (*str or bytes*) – the SMTP pass for authentication.
- **smtpport** (*int*) – the SMTP port to connect to
- **smtptls** (*bool*) – enforce using SMTP STARTTLS
- **smtpssl** (*bool*) – enforce using a secure SSL connection

send(*to*, *subject*, *body*, *cc=None*, *attachs=()*, *mimetype='text/plain'*, *charset=None*)

Send email to the given recipients.

Parameters

- **to** (*str or list*) – the e-mail recipients as a string or as a list of strings
- **subject** (*str*) – the subject of the e-mail
- **cc** (*str or list*) – the e-mails to CC as a string or as a list of strings

- **body** (*str*) – the e-mail body
- **attachs** (*collections.abc.Iterable*) – an iterable of tuples `(attach_name, mimetype, file_object)` where `attach_name` is a string with the name that will appear on the e-mail's attachment, `mimetype` is the mimetype of the attachment and `file_object` is a readable file object with the contents of the attachment
- **mimetype** (*str*) – the MIME type of the e-mail
- **charset** (*str*) – the character encoding to use for the e-mail contents

4.3.3 Mail settings

These settings define the default `__init__` method values of the *MailSender* class, and can be used to configure e-mail notifications in your project without writing any code (for those extensions and code that uses *MailSender*).

MAIL_FROM

Default: `'scrapy@localhost'`

Sender email to use (`From:` header) for sending emails.

MAIL_HOST

Default: `'localhost'`

SMTP host to use for sending emails.

MAIL_PORT

Default: `25`

SMTP port to use for sending emails.

MAIL_USER

Default: `None`

User to use for SMTP authentication. If disabled no SMTP authentication will be performed.

MAIL_PASS

Default: `None`

Password to use for SMTP authentication, along with *MAIL_USER*.

MAIL_TLS

Default: `False`

Enforce using STARTTLS. STARTTLS is a way to take an existing insecure connection, and upgrade it to a secure connection using SSL/TLS.

MAIL_SSL

Default: `False`

Enforce connecting using an SSL encrypted connection

4.4 Telnet Console

Scrapy comes with a built-in telnet console for inspecting and controlling a Scrapy running process. The telnet console is just a regular python shell running inside the Scrapy process, so you can do literally anything from it.

The telnet console is a *built-in Scrapy extension* which comes enabled by default, but you can also disable it if you want. For more information about the extension itself see *Telnet console extension*.

> **Warning**
>
> It is not secure to use telnet console via public networks, as telnet doesn't provide any transport-layer security. Having username/password authentication doesn't change that.
>
> Intended usage is connecting to a running Scrapy spider locally (spider process and telnet client are on the same machine) or over a secure connection (VPN, SSH tunnel). Please avoid using telnet console over insecure connections, or disable it completely using *TELNETCONSOLE_ENABLED* option.

4.4.1 How to access the telnet console

The telnet console listens in the TCP port defined in the *TELNETCONSOLE_PORT* setting, which defaults to `6023`. To access the console you need to type:

```
telnet localhost 6023
Trying localhost...
Connected to localhost.
Escape character is '^]'.
Username:
Password:
>>>
```

By default Username is `scrapy` and Password is autogenerated. The autogenerated Password can be seen on Scrapy logs like the example below:

```
2018-10-16 14:35:21 [scrapy.extensions.telnet] INFO: Telnet Password: 16f92501e8a59326
```

Default Username and Password can be overridden by the settings *TELNETCONSOLE_USERNAME* and *TELNETCONSOLE_PASSWORD*.

> **Warning**
>
> Username and password provide only a limited protection, as telnet is not using secure transport - by default traffic is not encrypted even if username and password are set.

You need the telnet program which comes installed by default in Windows, and most Linux distros.

4.4.2 Available variables in the telnet console

The telnet console is like a regular Python shell running inside the Scrapy process, so you can do anything from it including importing new modules, etc.

However, the telnet console comes with some default variables defined for convenience:

Shortcut	Description
`crawler`	the Scrapy Crawler (*`scrapy.crawler.Crawler`* object)
`engine`	Crawler.engine attribute
`spider`	the active spider
`extensions`	the Extension Manager (Crawler.extensions attribute)
`stats`	the Stats Collector (Crawler.stats attribute)
`settings`	the Scrapy settings object (Crawler.settings attribute)
`est`	print a report of the engine status
`prefs`	for memory debugging (see *Debugging memory leaks*)
`p`	a shortcut to the `pprint.pprint()` function
`hpy`	for memory debugging (see *Debugging memory leaks*)

4.4.3 Telnet console usage examples

Here are some example tasks you can do with the telnet console:

View engine status

You can use the `est()` method of the Scrapy engine to quickly show its state using the telnet console:

```
telnet localhost 6023
>>> est()
Execution engine status

time()-engine.start_time                        : 8.62972998619
len(engine.downloader.active)                   : 16
engine.scraper.is_idle()                        : False
engine.spider.name                              : followall
engine.spider_is_idle()                         : False
engine._slot.closing                            : False
len(engine._slot.inprogress)                    : 16
len(engine._slot.scheduler.dqs or [])           : 0
len(engine._slot.scheduler.mqs)                 : 92
len(engine.scraper.slot.queue)                  : 0
len(engine.scraper.slot.active)                 : 0
engine.scraper.slot.active_size                 : 0
engine.scraper.slot.itemproc_size               : 0
engine.scraper.slot.needs_backout()             : False
```

Pause, resume and stop the Scrapy engine

To pause:

```
telnet localhost 6023
>>> engine.pause()
>>>
```

To resume:

```
telnet localhost 6023
>>> engine.unpause()
>>>
```

To stop:

```
telnet localhost 6023
>>> engine.stop()
Connection closed by foreign host.
```

4.4.4 Telnet Console signals

scrapy.extensions.telnet.**update_telnet_vars**(*telnet_vars*)

Sent just before the telnet console is opened. You can hook up to this signal to add, remove or update the variables that will be available in the telnet local namespace. In order to do that, you need to update the `telnet_vars` dict in your handler.

Parameters
telnet_vars (*dict*) – the dict of telnet variables

4.4.5 Telnet settings

These are the settings that control the telnet console's behaviour:

TELNETCONSOLE_PORT

Default: `[6023, 6073]`

The port range to use for the telnet console. If set to `None`, a dynamically assigned port is used.

TELNETCONSOLE_HOST

Default: `'127.0.0.1'`

The interface the telnet console should listen on

TELNETCONSOLE_USERNAME

Default: `'scrapy'`

The username used for the telnet console

TELNETCONSOLE_PASSWORD

Default: `None`

The password used for the telnet console, default behaviour is to have it autogenerated

Logging
Learn how to use Python's builtin logging on Scrapy.

Stats Collection
Collect statistics about your scraping crawler.

Sending e-mail
Send email notifications when certain events occur.

Telnet Console
Inspect a running crawler using a built-in Python console.

CHAPTER

FIVE

SOLVING SPECIFIC PROBLEMS

5.1 Frequently Asked Questions

5.1.1 How does Scrapy compare to BeautifulSoup or lxml?

BeautifulSoup and lxml are libraries for parsing HTML and XML. Scrapy is an application framework for writing web spiders that crawl web sites and extract data from them.

Scrapy provides a built-in mechanism for extracting data (called *selectors*) but you can easily use BeautifulSoup (or lxml) instead, if you feel more comfortable working with them. After all, they're just parsing libraries which can be imported and used from any Python code.

In other words, comparing BeautifulSoup (or lxml) to Scrapy is like comparing jinja2 to Django.

5.1.2 Can I use Scrapy with BeautifulSoup?

Yes, you can. As mentioned *above*, BeautifulSoup can be used for parsing HTML responses in Scrapy callbacks. You just have to feed the response's body into a `BeautifulSoup` object and extract whatever data you need from it.

Here's an example spider using BeautifulSoup API, with `lxml` as the HTML parser:

```
from bs4 import BeautifulSoup
import scrapy

class ExampleSpider(scrapy.Spider):
    name = "example"
    allowed_domains = ["example.com"]
    start_urls = ("http://www.example.com/",)

    def parse(self, response):
        # use lxml to get decent HTML parsing speed
        soup = BeautifulSoup(response.text, "lxml")
        yield {"url": response.url, "title": soup.h1.string}
```

Note

`BeautifulSoup` supports several HTML/XML parsers. See BeautifulSoup's official documentation on which ones are available.

5.1.3 Did Scrapy "steal" X from Django?

Probably, but we don't like that word. We think Django is a great open source project and an example to follow, so we've used it as an inspiration for Scrapy.

We believe that, if something is already done well, there's no need to reinvent it. This concept, besides being one of the foundations for open source and free software, not only applies to software but also to documentation, procedures, policies, etc. So, instead of going through each problem ourselves, we choose to copy ideas from those projects that have already solved them properly, and focus on the real problems we need to solve.

We'd be proud if Scrapy serves as an inspiration for other projects. Feel free to steal from us!

5.1.4 Does Scrapy work with HTTP proxies?

Yes. Support for HTTP proxies is provided (since Scrapy 0.8) through the HTTP Proxy downloader middleware. See `HttpProxyMiddleware`.

5.1.5 How can I scrape an item with attributes in different pages?

See *Passing additional data to callback functions*.

5.1.6 How can I simulate a user login in my spider?

See *Using FormRequest.from_response() to simulate a user login*.

5.1.7 Does Scrapy crawl in breadth-first or depth-first order?

DFO by default, but other orders are possible.

5.1.8 My Scrapy crawler has memory leaks. What can I do?

See *Debugging memory leaks*.

Also, Python has a builtin memory leak issue which is described in *Leaks without leaks*.

5.1.9 How can I make Scrapy consume less memory?

See previous question.

5.1.10 How can I prevent memory errors due to many allowed domains?

If you have a spider with a long list of `allowed_domains` (e.g. 50,000+), consider replacing the default `OffsiteMiddleware` downloader middleware with a *custom downloader middleware* that requires less memory. For example:

- If your domain names are similar enough, use your own regular expression instead joining the strings in `allowed_domains` into a complex regular expression.
- If you can meet the installation requirements, use pyre2 instead of Python's re to compile your URL-filtering regular expression. See issue 1908.

See also other suggestions at StackOverflow.

> **Note**
>
> Remember to disable `scrapy.downloadermiddlewares.offsite.OffsiteMiddleware` when you enable your custom implementation:

```
DOWNLOADER_MIDDLEWARES = {
    "scrapy.downloadermiddlewares.offsite.OffsiteMiddleware": None,
    "myproject.middlewares.CustomOffsiteMiddleware": 50,
}
```

5.1.11 Can I use Basic HTTP Authentication in my spiders?

Yes, see *HttpAuthMiddleware*.

5.1.12 Why does Scrapy download pages in English instead of my native language?

Try changing the default Accept-Language request header by overriding the *DEFAULT_REQUEST_HEADERS* setting.

5.1.13 Where can I find some example Scrapy projects?

See *Examples*.

5.1.14 Can I run a spider without creating a project?

Yes. You can use the *runspider* command. For example, if you have a spider written in a `my_spider.py` file you can run it with:

```
scrapy runspider my_spider.py
```

See *runspider* command for more info.

5.1.15 I get "Filtered offsite request" messages. How can I fix them?

Those messages (logged with `DEBUG` level) don't necessarily mean there is a problem, so you may not need to fix them.

Those messages are thrown by *OffsiteMiddleware*, which is a downloader middleware (enabled by default) whose purpose is to filter out requests to domains outside the ones covered by the spider.

5.1.16 What is the recommended way to deploy a Scrapy crawler in production?

See *Deploying Spiders*.

5.1.17 Can I use JSON for large exports?

It'll depend on how large your output is. See *this warning* in *JsonItemExporter* documentation.

5.1.18 Can I return (Twisted) deferreds from signal handlers?

Some signals support returning deferreds from their handlers, others don't. See the *Built-in signals reference* to know which ones.

5.1.19 What does the response status code 999 mean?

999 is a custom response status code used by Yahoo sites to throttle requests. Try slowing down the crawling speed by using a download delay of `2` (or higher) in your spider:

```
from scrapy.spiders import CrawlSpider

class MySpider(CrawlSpider):
    name = "myspider"

    download_delay = 2

    # [ ... rest of the spider code ... ]
```

Or by setting a global download delay in your project with the *DOWNLOAD_DELAY* setting.

5.1.20 Can I call `pdb.set_trace()` from my spiders to debug them?

Yes, but you can also use the Scrapy shell which allows you to quickly analyze (and even modify) the response being processed by your spider, which is, quite often, more useful than plain old `pdb.set_trace()`.

For more info see *Invoking the shell from spiders to inspect responses*.

5.1.21 Simplest way to dump all my scraped items into a JSON/CSV/XML file?

To dump into a JSON file:

```
scrapy crawl myspider -O items.json
```

To dump into a CSV file:

```
scrapy crawl myspider -O items.csv
```

To dump into an XML file:

```
scrapy crawl myspider -O items.xml
```

For more information see *Feed exports*

5.1.22 What's this huge cryptic `__VIEWSTATE` parameter used in some forms?

The `__VIEWSTATE` parameter is used in sites built with ASP.NET/VB.NET. For more info on how it works see this page. Also, here's an example spider which scrapes one of these sites.

5.1.23 What's the best way to parse big XML/CSV data feeds?

Parsing big feeds with XPath selectors can be problematic since they need to build the DOM of the entire feed in memory, and this can be quite slow and consume a lot of memory.

In order to avoid parsing all the entire feed at once in memory, you can use the *xmliter_lxml()* and *csviter()* functions. In fact, this is what *XMLFeedSpider* uses.

scrapy.utils.iterators.**xmliter_lxml**(*obj:* Response | *str* | *bytes*, *nodename: str*, *namespace: str* | *None* = *None*, *prefix: str* = *'x'*) → Iterator[*Selector*]

scrapy.utils.iterators.**csviter**(*obj:* Response | *str* | *bytes*, *delimiter: str* | *None* = *None*, *headers: list[str]* | *None* = *None*, *encoding: str* | *None* = *None*, *quotechar: str* | *None* = *None*) → Iterator[dict[str, str]]

Returns an iterator of dictionaries from the given csv object

obj can be: - a Response object - a unicode string - a string encoded as utf-8

delimiter is the character used to separate fields on the given obj.

headers is an iterable that when provided offers the keys for the returned dictionaries, if not the first row is used.

quotechar is the character used to enclosure fields on the given obj.

5.1.24 Does Scrapy manage cookies automatically?

Yes, Scrapy receives and keeps track of cookies sent by servers, and sends them back on subsequent requests, like any regular web browser does.

For more info see *Requests and Responses* and *CookiesMiddleware*.

5.1.25 How can I see the cookies being sent and received from Scrapy?

Enable the `COOKIES_DEBUG` setting.

5.1.26 How can I instruct a spider to stop itself?

Raise the `CloseSpider` exception from a callback. For more info see: `CloseSpider`.

5.1.27 How can I prevent my Scrapy bot from getting banned?

See *Avoiding getting banned*.

5.1.28 Should I use spider arguments or settings to configure my spider?

Both *spider arguments* and *settings* can be used to configure your spider. There is no strict rule that mandates to use one or the other, but settings are more suited for parameters that, once set, don't change much, while spider arguments are meant to change more often, even on each spider run and sometimes are required for the spider to run at all (for example, to set the start url of a spider).

To illustrate with an example, assuming you have a spider that needs to log into a site to scrape data, and you only want to scrape data from a certain section of the site (which varies each time). In that case, the credentials to log in would be settings, while the url of the section to scrape would be a spider argument.

5.1.29 I'm scraping a XML document and my XPath selector doesn't return any items

You may need to remove namespaces. See *Removing namespaces*.

5.1.30 How to split an item into multiple items in an item pipeline?

Item pipelines cannot yield multiple items per input item. *Create a spider middleware* instead, and use its `process_spider_output()` method for this purpose. For example:

```
from copy import deepcopy

from itemadapter import ItemAdapter
from scrapy import Request

class MultiplyItemsMiddleware:
    def process_spider_output(self, response, result, spider):
        for item_or_request in result:
```

(continues on next page)

(continued from previous page)

```
            if isinstance(item_or_request, Request):
                continue
            adapter = ItemAdapter(item)
            for _ in range(adapter["multiply_by"]):
                yield deepcopy(item)
```

5.1.31 Does Scrapy support IPv6 addresses?

Yes, by setting *DNS_RESOLVER* to `scrapy.resolver.CachingHostnameResolver`. Note that by doing so, you lose the ability to set a specific timeout for DNS requests (the value of the *DNS_TIMEOUT* setting is ignored).

5.1.32 How to deal with `<class 'ValueError'>: filedescriptor out of range in select()` exceptions?

This issue has been reported to appear when running broad crawls in macOS, where the default Twisted reactor is `twisted.internet.selectreactor.SelectReactor`. Switching to a different reactor is possible by using the *TWISTED_REACTOR* setting.

5.1.33 How can I cancel the download of a given response?

In some situations, it might be useful to stop the download of a certain response. For instance, sometimes you can determine whether or not you need the full contents of a response by inspecting its headers or the first bytes of its body. In that case, you could save resources by attaching a handler to the *bytes_received* or *headers_received* signals and raising a *StopDownload* exception. Please refer to the *Stopping the download of a Response* topic for additional information and examples.

5.1.34 How can I make a blank request?

```
from scrapy import Request

blank_request = Request("data:,")
```

In this case, the URL is set to a data URI scheme. Data URLs allow you to include data inline within web pages, similar to external resources. The "data:" scheme with an empty content (",") essentially creates a request to a data URL without any specific content.

5.1.35 Running `runspider` I get `error: No spider found in file: <filename>`

This may happen if your Scrapy project has a spider module with a name that conflicts with the name of one of the Python standard library modules, such as `csv.py` or `os.py`, or any Python package that you have installed. See issue 2680.

5.2 Debugging Spiders

This document explains the most common techniques for debugging spiders. Consider the following Scrapy spider below:

```
import scrapy
from myproject.items import MyItem
```

(continues on next page)

(continued from previous page)

```
class MySpider(scrapy.Spider):
    name = "myspider"
    start_urls = (
        "http://example.com/page1",
        "http://example.com/page2",
    )

    def parse(self, response):
        # <processing code not shown>
        # collect `item_urls`
        for item_url in item_urls:
            yield scrapy.Request(item_url, self.parse_item)

    def parse_item(self, response):
        # <processing code not shown>
        item = MyItem()
        # populate `item` fields
        # and extract item_details_url
        yield scrapy.Request(
            item_details_url, self.parse_details, cb_kwargs={"item": item}
        )

    def parse_details(self, response, item):
        # populate more `item` fields
        return item
```

Basically this is a simple spider which parses two pages of items (the start_urls). Items also have a details page with additional information, so we use the `cb_kwargs` functionality of *Request* to pass a partially populated item.

5.2.1 Parse Command

The most basic way of checking the output of your spider is to use the *parse* command. It allows to check the behaviour of different parts of the spider at the method level. It has the advantage of being flexible and simple to use, but does not allow debugging code inside a method.

In order to see the item scraped from a specific url:

```
$ scrapy parse --spider=myspider -c parse_item -d 2 <item_url>
[ ... scrapy log lines crawling example.com spider ... ]

>>> STATUS DEPTH LEVEL 2 <<<
# Scraped Items  ------------------------------------------------------------
[{'url': <item_url>}]

# Requests  -----------------------------------------------------------------
[]
```

Using the `--verbose` or `-v` option we can see the status at each depth level:

```
$ scrapy parse --spider=myspider -c parse_item -d 2 -v <item_url>
[ ... scrapy log lines crawling example.com spider ... ]
```

(continues on next page)

(continued from previous page)

```
>>> DEPTH LEVEL: 1 <<<
# Scraped Items  ------------------------------------------------------------
[]

# Requests  -----------------------------------------------------------------
[<GET item_details_url>]

>>> DEPTH LEVEL: 2 <<<
# Scraped Items  ------------------------------------------------------------
[{'url': <item_url>}]

# Requests  -----------------------------------------------------------------
[]
```

Checking items scraped from a single start_url, can also be easily achieved using:

```
$ scrapy parse --spider=myspider -d 3 'http://example.com/page1'
```

5.2.2 Scrapy Shell

While the *parse* command is very useful for checking behaviour of a spider, it is of little help to check what happens inside a callback, besides showing the response received and the output. How to debug the situation when `parse_details` sometimes receives no item?

Fortunately, the *shell* is your bread and butter in this case (see *Invoking the shell from spiders to inspect responses*):

```
from scrapy.shell import inspect_response

def parse_details(self, response, item=None):
    if item:
        # populate more `item` fields
        return item
    else:
        inspect_response(response, self)
```

See also: *Invoking the shell from spiders to inspect responses*.

5.2.3 Open in browser

Sometimes you just want to see how a certain response looks in a browser, you can use the *open_in_browser()* function for that:

`scrapy.utils.response.`**open_in_browser**(*response: TextResponse*, *_openfunc: Callable[[str], Any] = <function open>*) → Any

Open *response* in a local web browser, adjusting the base tag for external links to work, e.g. so that images and styles are displayed.

For example:

```
from scrapy.utils.response import open_in_browser
```

(continues on next page)

(continued from previous page)

```
def parse_details(self, response):
    if "item name" not in response.body:
        open_in_browser(response)
```

5.2.4 Logging

Logging is another useful option for getting information about your spider run. Although not as convenient, it comes with the advantage that the logs will be available in all future runs should they be necessary again:

```
def parse_details(self, response, item=None):
    if item:
        # populate more `item` fields
        return item
    else:
        self.logger.warning("No item received for %s", response.url)
```

For more information, check the *Logging* section.

5.2.5 Visual Studio Code

To debug spiders with Visual Studio Code you can use the following `launch.json`:

```
{
    "version": "0.1.0",
    "configurations": [
        {
            "name": "Python: Launch Scrapy Spider",
            "type": "python",
            "request": "launch",
            "module": "scrapy",
            "args": [
                "runspider",
                "${file}"
            ],
            "console": "integratedTerminal"
        }
    ]
}
```

Also, make sure you enable "User Uncaught Exceptions", to catch exceptions in your Scrapy spider.

5.3 Spiders Contracts

Testing spiders can get particularly annoying and while nothing prevents you from writing unit tests the task gets cumbersome quickly. Scrapy offers an integrated way of testing your spiders by the means of contracts.

This allows you to test each callback of your spider by hardcoding a sample url and check various constraints for how the callback processes the response. Each contract is prefixed with an `@` and included in the docstring. See the following example:

```
def parse(self, response):
    """
```

(continues on next page)

(continued from previous page)

```
    This function parses a sample response. Some contracts are mingled
    with this docstring.

    @url http://www.example.com/s?field-keywords=selfish+gene
    @returns items 1 16
    @returns requests 0 0
    @scrapes Title Author Year Price
    """
```

You can use the following contracts:

class scrapy.contracts.default.**UrlContract**

This contract (`@url`) sets the sample URL used when checking other contract conditions for this spider. This contract is mandatory. All callbacks lacking this contract are ignored when running the checks:

```
@url url
```

class scrapy.contracts.default.**CallbackKeywordArgumentsContract**

This contract (`@cb_kwargs`) sets the *cb_kwargs* attribute for the sample request. It must be a valid JSON dictionary.

```
@cb_kwargs {"arg1": "value1", "arg2": "value2", ...}
```

class scrapy.contracts.default.**MetadataContract**

This contract (`@meta`) sets the *meta* attribute for the sample request. It must be a valid JSON dictionary.

```
@meta {"arg1": "value1", "arg2": "value2", ...}
```

class scrapy.contracts.default.**ReturnsContract**

This contract (`@returns`) sets lower and upper bounds for the items and requests returned by the spider. The upper bound is optional:

```
@returns item(s)|request(s) [min [max]]
```

class scrapy.contracts.default.**ScrapesContract**

This contract (`@scrapes`) checks that all the items returned by the callback have the specified fields:

```
@scrapes field_1 field_2 ...
```

Use the *check* command to run the contract checks.

5.3.1 Custom Contracts

If you find you need more power than the built-in Scrapy contracts you can create and load your own contracts in the project by using the *SPIDER_CONTRACTS* setting:

```
SPIDER_CONTRACTS = {
    "myproject.contracts.ResponseCheck": 10,
    "myproject.contracts.ItemValidate": 10,
}
```

Each contract must inherit from *Contract* and can override three methods:

class scrapy.contracts.**Contract**(*method*, **args*)

Parameters

- **method** (*collections.abc.Callable*) – callback function to which the contract is associated
- **args** (*list*) – list of arguments passed into the docstring (whitespace separated)

adjust_request_args(*args*)

This receives a `dict` as an argument containing default arguments for request object. *Request* is used by default, but this can be changed with the `request_cls` attribute. If multiple contracts in chain have this attribute defined, the last one is used.

Must return the same or a modified version of it.

pre_process(*response*)

This allows hooking in various checks on the response received from the sample request, before it's being passed to the callback.

post_process(*output*)

This allows processing the output of the callback. Iterators are converted to lists before being passed to this hook.

Raise *ContractFail* from *pre_process* or *post_process* if expectations are not met:

class scrapy.exceptions.**ContractFail**

Error raised in case of a failing contract

Here is a demo contract which checks the presence of a custom header in the response received:

```
from scrapy.contracts import Contract
from scrapy.exceptions import ContractFail

class HasHeaderContract(Contract):
    """
    Demo contract which checks the presence of a custom header
    @has_header X-CustomHeader
    """

    name = "has_header"

    def pre_process(self, response):
        for header in self.args:
            if header not in response.headers:
                raise ContractFail("X-CustomHeader not present")
```

5.3.2 Detecting check runs

When `scrapy check` is running, the `SCRAPY_CHECK` environment variable is set to the `true` string. You can use `os.environ` to perform any change to your spiders or your settings when `scrapy check` is used:

```
import os
import scrapy
```

(continues on next page)

(continued from previous page)

```
class ExampleSpider(scrapy.Spider):
    name = "example"

    def __init__(self):
        if os.environ.get("SCRAPY_CHECK"):
            pass  # Do some scraper adjustments when a check is running
```

5.4 Common Practices

This section documents common practices when using Scrapy. These are things that cover many topics and don't often fall into any other specific section.

5.4.1 Run Scrapy from a script

You can use the *API* to run Scrapy from a script, instead of the typical way of running Scrapy via `scrapy crawl`.

Remember that Scrapy is built on top of the Twisted asynchronous networking library, so you need to run it inside the Twisted reactor.

The first utility you can use to run your spiders is *scrapy.crawler.CrawlerProcess*. This class will start a Twisted reactor for you, configuring the logging and setting shutdown handlers. This class is the one used by all Scrapy commands.

Here's an example showing how to run a single spider with it.

```
import scrapy
from scrapy.crawler import CrawlerProcess

class MySpider(scrapy.Spider):
    # Your spider definition
    ...

process = CrawlerProcess(
    settings={
        "FEEDS": {
            "items.json": {"format": "json"},
        },
    }
)

process.crawl(MySpider)
process.start()  # the script will block here until the crawling is finished
```

Define settings within dictionary in CrawlerProcess. Make sure to check *CrawlerProcess* documentation to get acquainted with its usage details.

If you are inside a Scrapy project there are some additional helpers you can use to import those components within the project. You can automatically import your spiders passing their name to *CrawlerProcess*, and use `get_project_settings` to get a *Settings* instance with your project settings.

What follows is a working example of how to do that, using the testspiders project as example.

```
from scrapy.crawler import CrawlerProcess
from scrapy.utils.project import get_project_settings

process = CrawlerProcess(get_project_settings())

# 'followall' is the name of one of the spiders of the project.
process.crawl("followall", domain="scrapy.org")
process.start()  # the script will block here until the crawling is finished
```

There's another Scrapy utility that provides more control over the crawling process: *scrapy.crawler.CrawlerRunner*. This class is a thin wrapper that encapsulates some simple helpers to run multiple crawlers, but it won't start or interfere with existing reactors in any way.

Using this class the reactor should be explicitly run after scheduling your spiders. It's recommended you use *CrawlerRunner* instead of *CrawlerProcess* if your application is already using Twisted and you want to run Scrapy in the same reactor.

Note that you will also have to shutdown the Twisted reactor yourself after the spider is finished. This can be achieved by adding callbacks to the deferred returned by the *CrawlerRunner.crawl* method.

Here's an example of its usage, along with a callback to manually stop the reactor after `MySpider` has finished running.

```
import scrapy
from scrapy.crawler import CrawlerRunner
from scrapy.utils.log import configure_logging
from scrapy.utils.reactor import install_reactor

class MySpider(scrapy.Spider):
    # Your spider definition
    ...

install_reactor("twisted.internet.asyncioreactor.AsyncioSelectorReactor")
configure_logging({"LOG_FORMAT": "%(levelname)s: %(message)s"})
runner = CrawlerRunner()

d = runner.crawl(MySpider)

from twisted.internet import reactor

d.addBoth(lambda _: reactor.stop())
reactor.run()  # the script will block here until the crawling is finished
```

Same example but using a different reactor.

```
import scrapy
from scrapy.crawler import CrawlerRunner
from scrapy.utils.log import configure_logging
from scrapy.utils.reactor import install_reactor

class MySpider(scrapy.Spider):
    custom_settings = {
        "TWISTED_REACTOR": "twisted.internet.epollreactor.EPollReactor",
```

(continues on next page)

(continued from previous page)

```
    }
    # Your spider definition
    ...

install_reactor("twisted.internet.epollreactor.EPollReactor")
configure_logging({"LOG_FORMAT": "%(levelname)s: %(message)s"})
runner = CrawlerRunner()
d = runner.crawl(MySpider)

from twisted.internet import reactor

d.addBoth(lambda _: reactor.stop())
reactor.run()  # the script will block here until the crawling is finished
```

Reactor Overview

5.4.2 Running multiple spiders in the same process

By default, Scrapy runs a single spider per process when you run `scrapy crawl`. However, Scrapy supports running multiple spiders per process using the *internal API*.

Here is an example that runs multiple spiders simultaneously:

```
import scrapy
from scrapy.crawler import CrawlerProcess
from scrapy.utils.project import get_project_settings

class MySpider1(scrapy.Spider):
    # Your first spider definition
    ...

class MySpider2(scrapy.Spider):
    # Your second spider definition
    ...

settings = get_project_settings()
process = CrawlerProcess(settings)
process.crawl(MySpider1)
process.crawl(MySpider2)
process.start()  # the script will block here until all crawling jobs are finished
```

Same example using *CrawlerRunner*:

```
import scrapy
from scrapy.crawler import CrawlerRunner
from scrapy.utils.log import configure_logging
```

(continues on next page)

(continued from previous page)

```
from scrapy.utils.project import get_project_settings
from scrapy.utils.reactor import install_reactor

class MySpider1(scrapy.Spider):
    # Your first spider definition
    ...

class MySpider2(scrapy.Spider):
    # Your second spider definition
    ...

install_reactor("twisted.internet.asyncioreactor.AsyncioSelectorReactor")
configure_logging()
settings = get_project_settings()
runner = CrawlerRunner(settings)
runner.crawl(MySpider1)
runner.crawl(MySpider2)
d = runner.join()

from twisted.internet import reactor

d.addBoth(lambda _: reactor.stop())

reactor.run()  # the script will block here until all crawling jobs are finished
```

Same example but running the spiders sequentially by chaining the deferreds:

```
from twisted.internet import defer
from scrapy.crawler import CrawlerRunner
from scrapy.utils.log import configure_logging
from scrapy.utils.project import get_project_settings
from scrapy.utils.reactor import install_reactor

class MySpider1(scrapy.Spider):
    # Your first spider definition
    ...

class MySpider2(scrapy.Spider):
    # Your second spider definition
    ...

install_reactor("twisted.internet.asyncioreactor.AsyncioSelectorReactor")
settings = get_project_settings()
configure_logging(settings)
runner = CrawlerRunner(settings)
```

(continues on next page)

(continued from previous page)

```
@defer.inlineCallbacks
def crawl():
    yield runner.crawl(MySpider1)
    yield runner.crawl(MySpider2)
    reactor.stop()

from twisted.internet import reactor

crawl()
reactor.run()  # the script will block here until the last crawl call is finished
```

Note

When running multiple spiders in the same process, *reactor settings* should not have a different value per spider. Also, *pre-crawler settings* cannot be defined per spider.

Run Scrapy from a script.

5.4.3 Distributed crawls

Scrapy doesn't provide any built-in facility for running crawls in a distribute (multi-server) manner. However, there are some ways to distribute crawls, which vary depending on how you plan to distribute them.

If you have many spiders, the obvious way to distribute the load is to setup many Scrapyd instances and distribute spider runs among those.

If you instead want to run a single (big) spider through many machines, what you usually do is partition the urls to crawl and send them to each separate spider. Here is a concrete example:

First, you prepare the list of urls to crawl and put them into separate files/urls:

```
http://somedomain.com/urls-to-crawl/spider1/part1.list
http://somedomain.com/urls-to-crawl/spider1/part2.list
http://somedomain.com/urls-to-crawl/spider1/part3.list
```

Then you fire a spider run on 3 different Scrapyd servers. The spider would receive a (spider) argument `part` with the number of the partition to crawl:

```
curl http://scrapy1.mycompany.com:6800/schedule.json -d project=myproject -d␣
↪spider=spider1 -d part=1
curl http://scrapy2.mycompany.com:6800/schedule.json -d project=myproject -d␣
↪spider=spider1 -d part=2
curl http://scrapy3.mycompany.com:6800/schedule.json -d project=myproject -d␣
↪spider=spider1 -d part=3
```

5.4.4 Avoiding getting banned

Some websites implement certain measures to prevent bots from crawling them, with varying degrees of sophistication. Getting around those measures can be difficult and tricky, and may sometimes require special infrastructure. Please consider contacting commercial support if in doubt.

Here are some tips to keep in mind when dealing with these kinds of sites:

- rotate your user agent from a pool of well-known ones from browsers (google around to get a list of them)
- disable cookies (see *COOKIES_ENABLED*) as some sites may use cookies to spot bot behaviour
- use download delays (2 or higher). See *DOWNLOAD_DELAY* setting.
- if possible, use Common Crawl to fetch pages, instead of hitting the sites directly
- use a pool of rotating IPs. For example, the free Tor project or paid services like ProxyMesh. An open source alternative is scrapoxy, a super proxy that you can attach your own proxies to.
- use a ban avoidance service, such as Zyte API, which provides a Scrapy plugin and additional features, like AI web scraping

If you are still unable to prevent your bot getting banned, consider contacting commercial support.

5.5 Broad Crawls

Scrapy defaults are optimized for crawling specific sites. These sites are often handled by a single Scrapy spider, although this is not necessary or required (for example, there are generic spiders that handle any given site thrown at them).

In addition to this "focused crawl", there is another common type of crawling which covers a large (potentially unlimited) number of domains, and is only limited by time or other arbitrary constraint, rather than stopping when the domain was crawled to completion or when there are no more requests to perform. These are called "broad crawls" and is the typical crawlers employed by search engines.

These are some common properties often found in broad crawls:

- they crawl many domains (often, unbounded) instead of a specific set of sites
- they don't necessarily crawl domains to completion, because it would be impractical (or impossible) to do so, and instead limit the crawl by time or number of pages crawled
- they are simpler in logic (as opposed to very complex spiders with many extraction rules) because data is often post-processed in a separate stage
- they crawl many domains concurrently, which allows them to achieve faster crawl speeds by not being limited by any particular site constraint (each site is crawled slowly to respect politeness, but many sites are crawled in parallel)

As said above, Scrapy default settings are optimized for focused crawls, not broad crawls. However, due to its asynchronous architecture, Scrapy is very well suited for performing fast broad crawls. This page summarizes some things you need to keep in mind when using Scrapy for doing broad crawls, along with concrete suggestions of Scrapy settings to tune in order to achieve an efficient broad crawl.

5.5.1 Use the right `SCHEDULER_PRIORITY_QUEUE`

Scrapy's default scheduler priority queue is `'scrapy.pqueues.ScrapyPriorityQueue'`. It works best during single-domain crawl. It does not work well with crawling many different domains in parallel

To apply the recommended priority queue use:

```
SCHEDULER_PRIORITY_QUEUE = "scrapy.pqueues.DownloaderAwarePriorityQueue"
```

5.5.2 Increase concurrency

Concurrency is the number of requests that are processed in parallel. There is a global limit (*CONCURRENT_REQUESTS*) and an additional limit that can be set either per domain (*CONCURRENT_REQUESTS_PER_DOMAIN*) or per IP (*CONCURRENT_REQUESTS_PER_IP*).

Note

The scheduler priority queue *recommended for broad crawls* does not support *CONCURRENT_REQUESTS_PER_IP*.

The default global concurrency limit in Scrapy is not suitable for crawling many different domains in parallel, so you will want to increase it. How much to increase it will depend on how much CPU and memory your crawler will have available.

A good starting point is `100`:

```
CONCURRENT_REQUESTS = 100
```

But the best way to find out is by doing some trials and identifying at what concurrency your Scrapy process gets CPU bounded. For optimum performance, you should pick a concurrency where CPU usage is at 80-90%.

Increasing concurrency also increases memory usage. If memory usage is a concern, you might need to lower your global concurrency limit accordingly.

5.5.3 Increase Twisted IO thread pool maximum size

Currently Scrapy does DNS resolution in a blocking way with usage of thread pool. With higher concurrency levels the crawling could be slow or even fail hitting DNS resolver timeouts. Possible solution to increase the number of threads handling DNS queries. The DNS queue will be processed faster speeding up establishing of connection and crawling overall.

To increase maximum thread pool size use:

```
REACTOR_THREADPOOL_MAXSIZE = 20
```

5.5.4 Setup your own DNS

If you have multiple crawling processes and single central DNS, it can act like DoS attack on the DNS server resulting to slow down of entire network or even blocking your machines. To avoid this setup your own DNS server with local cache and upstream to some large DNS like OpenDNS or Verizon.

5.5.5 Reduce log level

When doing broad crawls you are often only interested in the crawl rates you get and any errors found. These stats are reported by Scrapy when using the `INFO` log level. In order to save CPU (and log storage requirements) you should not use `DEBUG` log level when performing large broad crawls in production. Using `DEBUG` level when developing your (broad) crawler may be fine though.

To set the log level use:

```
LOG_LEVEL = "INFO"
```

5.5.6 Disable cookies

Disable cookies unless you *really* need. Cookies are often not needed when doing broad crawls (search engine crawlers ignore them), and they improve performance by saving some CPU cycles and reducing the memory footprint of your Scrapy crawler.

To disable cookies use:

```
COOKIES_ENABLED = False
```

5.5.7 Disable retries

Retrying failed HTTP requests can slow down the crawls substantially, specially when sites causes are very slow (or fail) to respond, thus causing a timeout error which gets retried many times, unnecessarily, preventing crawler capacity to be reused for other domains.

To disable retries use:

```
RETRY_ENABLED = False
```

5.5.8 Reduce download timeout

Unless you are crawling from a very slow connection (which shouldn't be the case for broad crawls) reduce the download timeout so that stuck requests are discarded quickly and free up capacity to process the next ones.

To reduce the download timeout use:

```
DOWNLOAD_TIMEOUT = 15
```

5.5.9 Disable redirects

Consider disabling redirects, unless you are interested in following them. When doing broad crawls it's common to save redirects and resolve them when revisiting the site at a later crawl. This also help to keep the number of request constant per crawl batch, otherwise redirect loops may cause the crawler to dedicate too many resources on any specific domain.

To disable redirects use:

```
REDIRECT_ENABLED = False
```

5.5.10 Crawl in BFO order

Scrapy crawls in DFO order by default.

In broad crawls, however, page crawling tends to be faster than page processing. As a result, unprocessed early requests stay in memory until the final depth is reached, which can significantly increase memory usage.

Crawl in BFO order instead to save memory.

5.5.11 Be mindful of memory leaks

If your broad crawl shows a high memory usage, in addition to *crawling in BFO order* and *lowering concurrency* you should *debug your memory leaks*.

5.5.12 Install a specific Twisted reactor

If the crawl is exceeding the system's capabilities, you might want to try installing a specific Twisted reactor, via the *TWISTED_REACTOR* setting.

5.6 Using your browser's Developer Tools for scraping

Here is a general guide on how to use your browser's Developer Tools to ease the scraping process. Today almost all browsers come with built in Developer Tools and although we will use Firefox in this guide, the concepts are applicable to any other browser.

In this guide we'll introduce the basic tools to use from a browser's Developer Tools by scraping quotes.toscrape.com.

5.6.1 Caveats with inspecting the live browser DOM

Since Developer Tools operate on a live browser DOM, what you'll actually see when inspecting the page source is not the original HTML, but a modified one after applying some browser clean up and executing JavaScript code. Firefox, in particular, is known for adding `<tbody>` elements to tables. Scrapy, on the other hand, does not modify the original page HTML, so you won't be able to extract any data if you use `<tbody>` in your XPath expressions.

Therefore, you should keep in mind the following things:

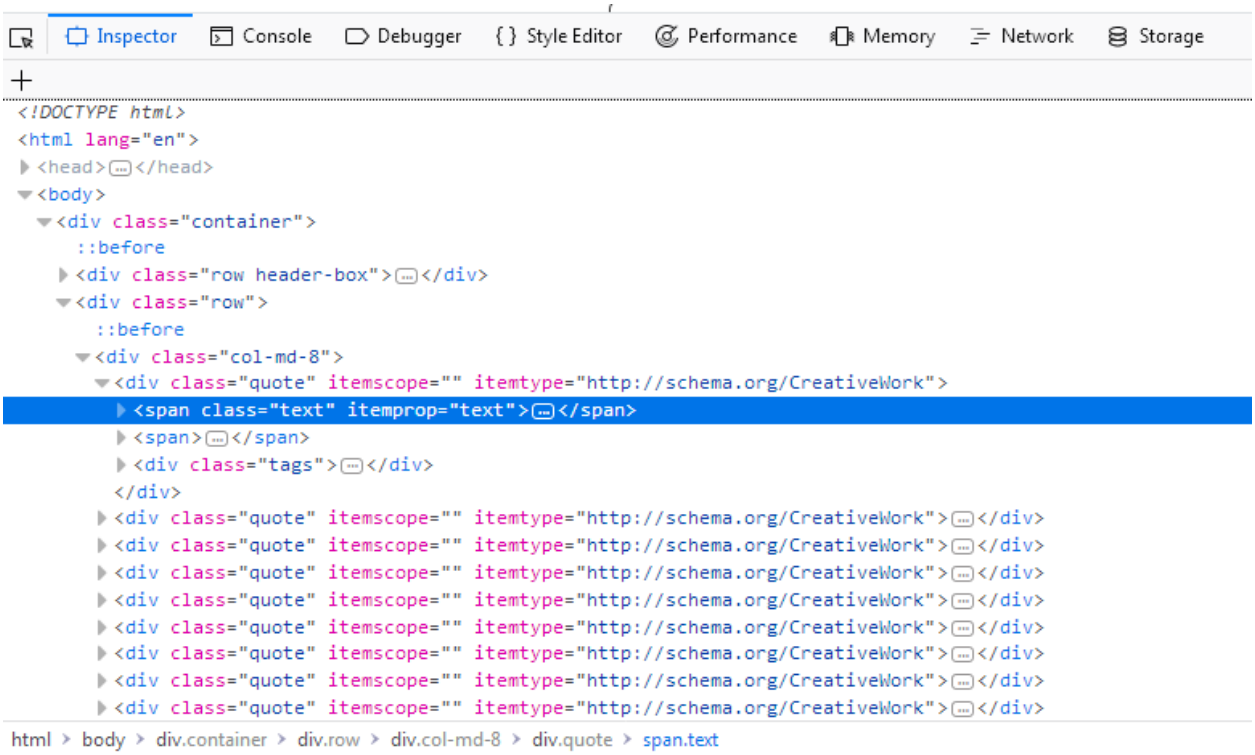
- Disable JavaScript while inspecting the DOM looking for XPaths to be used in Scrapy (in the Developer Tools settings click *Disable JavaScript*)
- Never use full XPath paths, use relative and clever ones based on attributes (such as `id`, `class`, `width`, etc) or any identifying features like `contains(@href, 'image')`.
- Never include `<tbody>` elements in your XPath expressions unless you really know what you're doing

5.6.2 Inspecting a website

By far the most handy feature of the Developer Tools is the *Inspector* feature, which allows you to inspect the underlying HTML code of any webpage. To demonstrate the Inspector, let's look at the quotes.toscrape.com-site.

On the site we have a total of ten quotes from various authors with specific tags, as well as the Top Ten Tags. Let's say we want to extract all the quotes on this page, without any meta-information about authors, tags, etc.

Instead of viewing the whole source code for the page, we can simply right click on a quote and select `Inspect Element (Q)`, which opens up the *Inspector*. In it you should see something like this:



The interesting part for us is this:

```
<div class="quote" itemscope="" itemtype="http://schema.org/CreativeWork">
  <span class="text" itemprop="text">(...)</span>
  <span>(...)</span>
  <div class="tags">(...)</div>
</div>
```

If you hover over the first `div` directly above the `span` tag highlighted in the screenshot, you'll see that the corresponding section of the webpage gets highlighted as well. So now we have a section, but we can't find our quote text anywhere.

The advantage of the *Inspector* is that it automatically expands and collapses sections and tags of a webpage, which greatly improves readability. You can expand and collapse a tag by clicking on the arrow in front of it or by double clicking directly on the tag. If we expand the `span` tag with the `class= "text"` we will see the quote-text we clicked on. The *Inspector* lets you copy XPaths to selected elements. Let's try it out.

First open the Scrapy shell at https://quotes.toscrape.com/ in a terminal:

```
$ scrapy shell "https://quotes.toscrape.com/"
```

Then, back to your web browser, right-click on the `span` tag, select `Copy > XPath` and paste it in the Scrapy shell like so:

```
>>> response.xpath("/html/body/div/div[2]/div[1]/div[1]/span[1]/text()").getall()
['“The world as we have created it is a process of our thinking. It cannot be changed␣
↪without changing our thinking.”']
```

Adding `text()` at the end we are able to extract the first quote with this basic selector. But this XPath is not really that clever. All it does is go down a desired path in the source code starting from `html`. So let's see if we can refine our XPath a bit:

If we check the *Inspector* again we'll see that directly beneath our expanded `div` tag we have nine identical `div` tags,

each with the same attributes as our first. If we expand any of them, we'll see the same structure as with our first quote: Two `span` tags and one `div` tag. We can expand each `span` tag with the `class="text"` inside our `div` tags and see each quote:

```
<div class="quote" itemscope="" itemtype="http://schema.org/CreativeWork">
  <span class="text" itemprop="text">
    “The world as we have created it is a process of our thinking. It cannot be changed␣
↪without changing our thinking.”
  </span>
  <span>(...)</span>
  <div class="tags">(...)</div>
</div>
```

With this knowledge we can refine our XPath: Instead of a path to follow, we'll simply select all `span` tags with the `class="text"` by using the has-class-extension:

```
>>> response.xpath('//span[has-class("text")]/text()').getall()
['“The world as we have created it is a process of our thinking. It cannot be changed␣
↪without changing our thinking.”',
'“It is our choices, Harry, that show what we truly are, far more than our abilities.”',
'“There are only two ways to live your life. One is as though nothing is a miracle. The␣
↪other is as though everything is a miracle.”',
...]
```

And with one simple, cleverer XPath we are able to extract all quotes from the page. We could have constructed a loop over our first XPath to increase the number of the last `div`, but this would have been unnecessarily complex and by simply constructing an XPath with `has-class("text")` we were able to extract all quotes in one line.

The *Inspector* has a lot of other helpful features, such as searching in the source code or directly scrolling to an element you selected. Let's demonstrate a use case:

Say you want to find the `Next` button on the page. Type `Next` into the search bar on the top right of the *Inspector*. You should get two results. The first is a `li` tag with the `class="next"`, the second the text of an `a` tag. Right click on the `a` tag and select `Scroll into View`. If you hover over the tag, you'll see the button highlighted. From here we could easily create a *Link Extractor* to follow the pagination. On a simple site such as this, there may not be the need to find an element visually but the `Scroll into View` function can be quite useful on complex sites.

Note that the search bar can also be used to search for and test CSS selectors. For example, you could search for `span.text` to find all quote texts. Instead of a full text search, this searches for exactly the `span` tag with the `class="text"` in the page.

5.6.3 The Network-tool

While scraping you may come across dynamic webpages where some parts of the page are loaded dynamically through multiple requests. While this can be quite tricky, the *Network*-tool in the Developer Tools greatly facilitates this task. To demonstrate the Network-tool, let's take a look at the page quotes.toscrape.com/scroll.

The page is quite similar to the basic quotes.toscrape.com-page, but instead of the above-mentioned `Next` button, the page automatically loads new quotes when you scroll to the bottom. We could go ahead and try out different XPaths directly, but instead we'll check another quite useful command from the Scrapy shell:

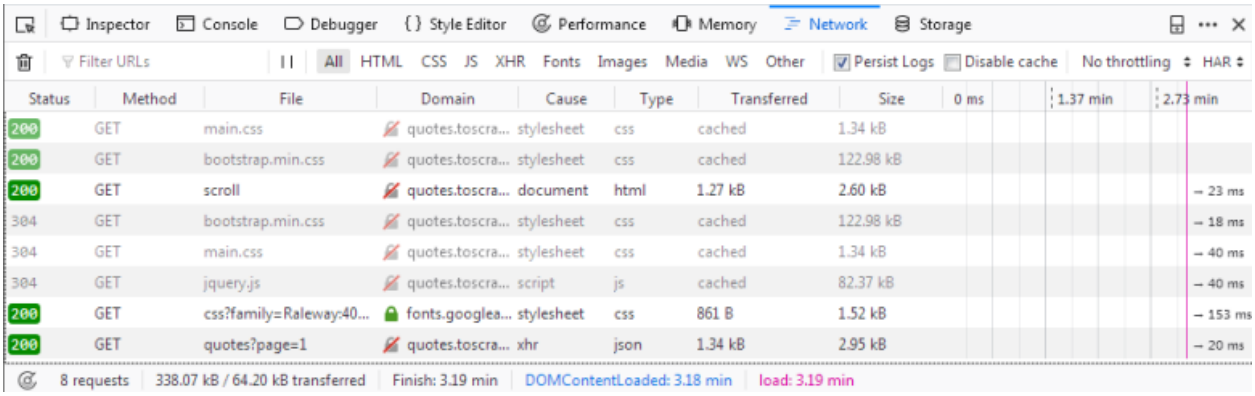
```
$ scrapy shell "quotes.toscrape.com/scroll"
(...)
>>> view(response)
```

A browser window should open with the webpage but with one crucial difference: Instead of the quotes we just see a greenish bar with the word `Loading...`.

The `view(response)` command let's us view the response our shell or later our spider receives from the server. Here we see that some basic template is loaded which includes the title, the login-button and the footer, but the quotes are missing. This tells us that the quotes are being loaded from a different request than `quotes.toscrape/scroll`.

If you click on the `Network` tab, you will probably only see two entries. The first thing we do is enable persistent logs by clicking on `Persist Logs`. If this option is disabled, the log is automatically cleared each time you navigate to a different page. Enabling this option is a good default, since it gives us control on when to clear the logs.

If we reload the page now, you'll see the log get populated with six new requests.

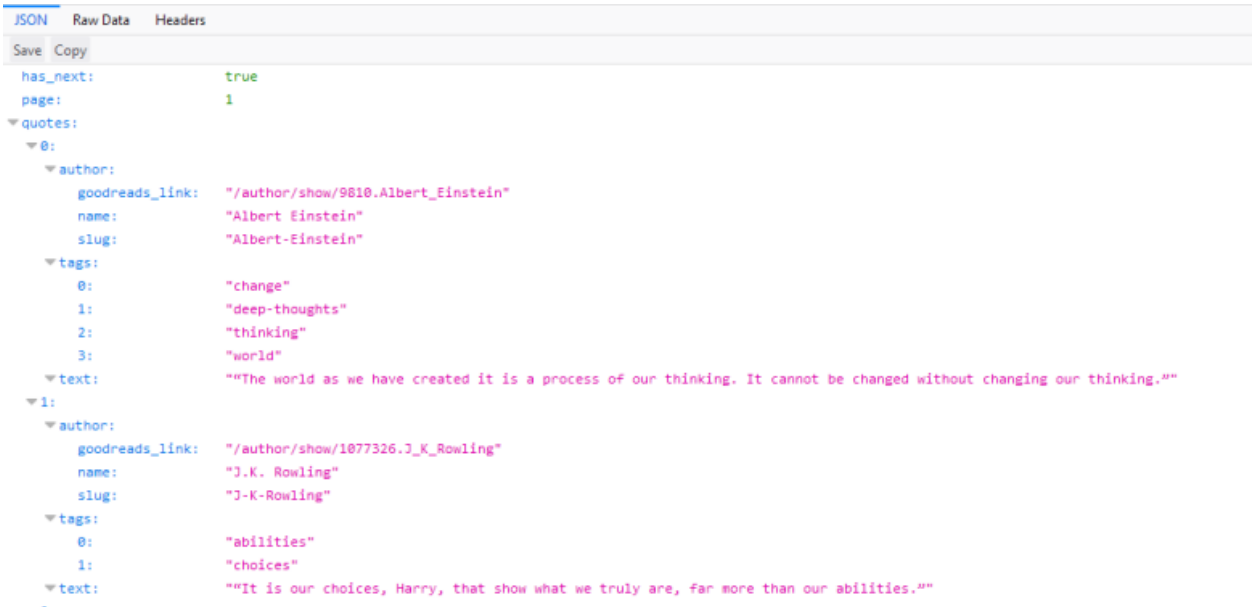


Here we see every request that has been made when reloading the page and can inspect each request and its response. So let's find out where our quotes are coming from:

First click on the request with the name `scroll`. On the right you can now inspect the request. In `Headers` you'll find details about the request headers, such as the URL, the method, the IP-address, and so on. We'll ignore the other tabs and click directly on `Response`.

What you should see in the `Preview` pane is the rendered HTML-code, that is exactly what we saw when we called `view(response)` in the shell. Accordingly the `type` of the request in the log is `html`. The other requests have types like `css` or `js`, but what interests us is the one request called `quotes?page=1` with the type `json`.

If we click on this request, we see that the request URL is `https://quotes.toscrape.com/api/quotes?page=1` and the response is a JSON-object that contains our quotes. We can also right-click on the request and open `Open in new tab` to get a better overview.



With this response we can now easily parse the JSON-object and also request each page to get every quote on the site:

```
import scrapy
import json

class QuoteSpider(scrapy.Spider):
    name = "quote"
    allowed_domains = ["quotes.toscrape.com"]
    page = 1
    start_urls = ["https://quotes.toscrape.com/api/quotes?page=1"]

    def parse(self, response):
        data = json.loads(response.text)
        for quote in data["quotes"]:
            yield {"quote": quote["text"]}
        if data["has_next"]:
            self.page += 1
            url = f"https://quotes.toscrape.com/api/quotes?page={self.page}"
            yield scrapy.Request(url=url, callback=self.parse)
```

This spider starts at the first page of the quotes-API. With each response, we parse the `response.text` and assign it to `data`. This lets us operate on the JSON-object like on a Python dictionary. We iterate through the `quotes` and print out the `quote["text"]`. If the handy `has_next` element is `true` (try loading quotes.toscrape.com/api/quotes?page=10 in your browser or a page-number greater than 10), we increment the `page` attribute and `yield` a new request, inserting the incremented page-number into our `url`.

In more complex websites, it could be difficult to easily reproduce the requests, as we could need to add `headers` or `cookies` to make it work. In those cases you can export the requests in cURL format, by right-clicking on each of them in the network tool and using the *from_curl()* method to generate an equivalent request:

```
from scrapy import Request

request = Request.from_curl(
    "curl 'https://quotes.toscrape.com/api/quotes?page=1' -H 'User-Agent: Mozil"
```

(continues on next page)

(continued from previous page)

```
    "la/5.0 (X11; Linux x86_64; rv:67.0) Gecko/20100101 Firefox/67.0' -H 'Acce"
    "pt: */*' -H 'Accept-Language: ca,en-US;q=0.7,en;q=0.3' --compressed -H 'X"
    "-Requested-With: XMLHttpRequest' -H 'Proxy-Authorization: Basic QFRLLTAzM"
    "zEwZTAxLTk5MWUtNDFiNC1iZWRmLTJjNGI4M2ZiNDBmNDpAVEstMDMzMTBlMDEtOTkxZS00MW"
    "I0LWJlZGYtMmM0YjgzZmI0MGY0' -H 'Connection: keep-alive' -H 'Referer: http"
    "://quotes.toscrape.com/scroll' -H 'Cache-Control: max-age=0'"
)
```

Alternatively, if you want to know the arguments needed to recreate that request you can use the *curl_to_request_kwargs()* function to get a dictionary with the equivalent arguments:

scrapy.utils.curl.**curl_to_request_kwargs**(*curl_command: str*, *ignore_unknown_options: bool = True*) → dict[str, Any]

Convert a cURL command syntax to Request kwargs.

Parameters

- **curl_command** (*str*) – string containing the curl command
- **ignore_unknown_options** (*bool*) – If true, only a warning is emitted when cURL options are unknown. Otherwise raises an error. (default: True)

Returns

dictionary of Request kwargs

Note that to translate a cURL command into a Scrapy request, you may use curl2scrapy.

As you can see, with a few inspections in the *Network*-tool we were able to easily replicate the dynamic requests of the scrolling functionality of the page. Crawling dynamic pages can be quite daunting and pages can be very complex, but it (mostly) boils down to identifying the correct request and replicating it in your spider.

5.7 Selecting dynamically-loaded content

Some webpages show the desired data when you load them in a web browser. However, when you download them using Scrapy, you cannot reach the desired data using *selectors*.

When this happens, the recommended approach is to *find the data source* and extract the data from it.

If you fail to do that, and you can nonetheless access the desired data through the *DOM* from your web browser, see *Using a headless browser*.

5.7.1 Finding the data source

To extract the desired data, you must first find its source location.

If the data is in a non-text-based format, such as an image or a PDF document, use the *network tool* of your web browser to find the corresponding request, and *reproduce it*.

If your web browser lets you select the desired data as text, the data may be defined in embedded JavaScript code, or loaded from an external resource in a text-based format.

In that case, you can use a tool like wgrep to find the URL of that resource.

If the data turns out to come from the original URL itself, you must *inspect the source code of the webpage* to determine where the data is located.

If the data comes from a different URL, you will need to *reproduce the corresponding request*.

5.7.2 Inspecting the source code of a webpage

Sometimes you need to inspect the source code of a webpage (not the *DOM*) to determine where some desired data is located.

Use Scrapy's `fetch` command to download the webpage contents as seen by Scrapy:

```
scrapy fetch --nolog https://example.com > response.html
```

If the desired data is in embedded JavaScript code within a <script/> element, see *Parsing JavaScript code*.

If you cannot find the desired data, first make sure it's not just Scrapy: download the webpage with an HTTP client like curl or wget and see if the information can be found in the response they get.

If they get a response with the desired data, modify your Scrapy `Request` to match that of the other HTTP client. For example, try using the same user-agent string (`USER_AGENT`) or the same `headers`.

If they also get a response without the desired data, you'll need to take steps to make your request more similar to that of the web browser. See *Reproducing requests*.

5.7.3 Reproducing requests

Sometimes we need to reproduce a request the way our web browser performs it.

Use the *network tool* of your web browser to see how your web browser performs the desired request, and try to reproduce that request with Scrapy.

It might be enough to yield a `Request` with the same HTTP method and URL. However, you may also need to reproduce the body, headers and form parameters (see `FormRequest`) of that request.

As all major browsers allow to export the requests in curl format, Scrapy incorporates the method `from_curl()` to generate an equivalent `Request` from a cURL command. To get more information visit *request from curl* inside the network tool section.

Once you get the expected response, you can *extract the desired data from it*.

You can reproduce any request with Scrapy. However, some times reproducing all necessary requests may not seem efficient in developer time. If that is your case, and crawling speed is not a major concern for you, you can alternatively consider *using a headless browser*.

If you get the expected response *sometimes*, but not always, the issue is probably not your request, but the target server. The target server might be buggy, overloaded, or *banning* some of your requests.

Note that to translate a cURL command into a Scrapy request, you may use curl2scrapy.

5.7.4 Handling different response formats

Once you have a response with the desired data, how you extract the desired data from it depends on the type of response:

- If the response is HTML, XML or JSON, use *selectors* as usual.
- If the response is JSON, use `response.json()` to load the desired data:

  ```
  data = response.json()
  ```

  If the desired data is inside HTML or XML code embedded within JSON data, you can load that HTML or XML code into a `Selector` and then *use it* as usual:

  ```
  selector = Selector(data["html"])
  ```

- If the response is JavaScript, or HTML with a <script/> element containing the desired data, see *Parsing JavaScript code*.

- If the response is CSS, use a regular expression to extract the desired data from `response.text`.
- If the response is an image or another format based on images (e.g. PDF), read the response as bytes from `response.body` and use an OCR solution to extract the desired data as text.

  For example, you can use pytesseract. To read a table from a PDF, tabula-py may be a better choice.
- If the response is SVG, or HTML with embedded SVG containing the desired data, you may be able to extract the desired data using *selectors*, since SVG is based on XML.

  Otherwise, you might need to convert the SVG code into a raster image, and *handle that raster image*.

5.7.5 Parsing JavaScript code

If the desired data is hardcoded in JavaScript, you first need to get the JavaScript code:

- If the JavaScript code is in a JavaScript file, simply read `response.text`.
- If the JavaScript code is within a `<script/>` element of an HTML page, use *selectors* to extract the text within that `<script/>` element.

Once you have a string with the JavaScript code, you can extract the desired data from it:

- You might be able to use a regular expression to extract the desired data in JSON format, which you can then parse with `json.loads()`.

  For example, if the JavaScript code contains a separate line like `var data = {"field": "value"};` you can extract that data as follows:

```
>>> pattern = r"\bvar\s+data\s*=\s*(\{.*?\})\s*;\s*\n"
>>> json_data = response.css("script::text").re_first(pattern)
>>> json.loads(json_data)
{'field': 'value'}
```

- chompjs provides an API to parse JavaScript objects into a `dict`.

  For example, if the JavaScript code contains `var data = {field: "value", secondField: "second value"};` you can extract that data as follows:

```
>>> import chompjs
>>> javascript = response.css("script::text").get()
>>> data = chompjs.parse_js_object(javascript)
>>> data
{'field': 'value', 'secondField': 'second value'}
```

- Otherwise, use js2xml to convert the JavaScript code into an XML document that you can parse using *selectors*.

  For example, if the JavaScript code contains `var data = {field: "value"};` you can extract that data as follows:

```
>>> import js2xml
>>> import lxml.etree
>>> from parsel import Selector
>>> javascript = response.css("script::text").get()
>>> xml = lxml.etree.tostring(js2xml.parse(javascript), encoding="unicode")
>>> selector = Selector(text=xml)
>>> selector.css('var[name="data"]').get()
'<var name="data"><object><property name="field"><string>value</string></property></
↪object></var>'
```

5.7.6 Using a headless browser

On webpages that fetch data from additional requests, reproducing those requests that contain the desired data is the preferred approach. The effort is often worth the result: structured, complete data with minimum parsing time and network transfer.

However, sometimes it can be really hard to reproduce certain requests. Or you may need something that no request can give you, such as a screenshot of a webpage as seen in a web browser. In this case using a headless browser will help.

A headless browser is a special web browser that provides an API for automation. By installing the *asyncio reactor*, it is possible to integrate `asyncio`-based libraries which handle headless browsers.

One such library is playwright-python (an official Python port of playwright). The following is a simple snippet to illustrate its usage within a Scrapy spider:

```
import scrapy
from playwright.async_api import async_playwright

class PlaywrightSpider(scrapy.Spider):
    name = "playwright"
    start_urls = ["data:,"]  # avoid using the default Scrapy downloader

    async def parse(self, response):
        async with async_playwright() as pw:
            browser = await pw.chromium.launch()
            page = await browser.new_page()
            await page.goto("https://example.org")
            title = await page.title()
            return {"title": title}
```

However, using playwright-python directly as in the above example circumvents most of the Scrapy components (middlewares, dupefilter, etc). We recommend using scrapy-playwright for a better integration.

5.8 Debugging memory leaks

In Scrapy, objects such as requests, responses and items have a finite lifetime: they are created, used for a while, and finally destroyed.

From all those objects, the Request is probably the one with the longest lifetime, as it stays waiting in the Scheduler queue until it's time to process it. For more info see *Architecture overview*.

As these Scrapy objects have a (rather long) lifetime, there is always the risk of accumulating them in memory without releasing them properly and thus causing what is known as a "memory leak".

To help debugging memory leaks, Scrapy provides a built-in mechanism for tracking objects references called *trackref*, and you can also use a third-party library called *muppy* for more advanced memory debugging (see below for more info). Both mechanisms must be used from the *Telnet Console*.

5.8.1 Common causes of memory leaks

It happens quite often (sometimes by accident, sometimes on purpose) that the Scrapy developer passes objects referenced in Requests (for example, using the `cb_kwargs` or `meta` attributes or the request callback function) and that effectively bounds the lifetime of those referenced objects to the lifetime of the Request. This is, by far, the most common cause of memory leaks in Scrapy projects, and a quite difficult one to debug for newcomers.

In big projects, the spiders are typically written by different people and some of those spiders could be "leaking" and thus affecting the rest of the other (well-written) spiders when they get to run concurrently, which, in turn, affects the whole crawling process.

The leak could also come from a custom middleware, pipeline or extension that you have written, if you are not releasing the (previously allocated) resources properly. For example, allocating resources on *spider_opened* but not releasing them on *spider_closed* may cause problems if you're running *multiple spiders per process*.

Too Many Requests?

By default Scrapy keeps the request queue in memory; it includes *Request* objects and all objects referenced in Request attributes (e.g. in *cb_kwargs* and *meta*). While not necessarily a leak, this can take a lot of memory. Enabling *persistent job queue* could help keeping memory usage in control.

5.8.2 Debugging memory leaks with `trackref`

`trackref` is a module provided by Scrapy to debug the most common cases of memory leaks. It basically tracks the references to all live Request, Response, Item, Spider and Selector objects.

You can enter the telnet console and inspect how many objects (of the classes mentioned above) are currently alive using the `prefs()` function which is an alias to the *print_live_refs()* function:

```
telnet localhost 6023

.. code-block:: pycon

    >>> prefs()
    Live References

    ExampleSpider                       1   oldest: 15s ago
    HtmlResponse                       10   oldest: 1s ago
    Selector                            2   oldest: 0s ago
    FormRequest                       878   oldest: 7s ago
```

As you can see, that report also shows the "age" of the oldest object in each class. If you're running multiple spiders per process chances are you can figure out which spider is leaking by looking at the oldest request or response. You can get the oldest object of each class using the *get_oldest()* function (from the telnet console).

Which objects are tracked?

The objects tracked by `trackrefs` are all from these classes (and all its subclasses):

- *scrapy.Request*
- *scrapy.http.Response*
- *scrapy.Item*
- *scrapy.Selector*
- *scrapy.Spider*

A real example

Let's see a concrete example of a hypothetical case of memory leaks. Suppose we have some spider with a line similar to this one:

```
return Request(f"http://www.somenastyspider.com/product.php?pid={product_id}",
               callback=self.parse, cb_kwargs={'referer': response})
```

That line is passing a response reference inside a request which effectively ties the response lifetime to the requests' one, and that would definitely cause memory leaks.

Let's see how we can discover the cause (without knowing it a priori, of course) by using the `trackref` tool.

After the crawler is running for a few minutes and we notice its memory usage has grown a lot, we can enter its telnet console and check the live references:

```
>>> prefs()
Live References

SomenastySpider                     1   oldest: 15s ago
HtmlResponse                     3890   oldest: 265s ago
Selector                            2   oldest: 0s ago
Request                          3878   oldest: 250s ago
```

The fact that there are so many live responses (and that they're so old) is definitely suspicious, as responses should have a relatively short lifetime compared to Requests. The number of responses is similar to the number of requests, so it looks like they are tied in a some way. We can now go and check the code of the spider to discover the nasty line that is generating the leaks (passing response references inside requests).

Sometimes extra information about live objects can be helpful. Let's check the oldest response:

```
>>> from scrapy.utils.trackref import get_oldest
>>> r = get_oldest("HtmlResponse")
>>> r.url
'http://www.somenastyspider.com/product.php?pid=123'
```

If you want to iterate over all objects, instead of getting the oldest one, you can use the *scrapy.utils.trackref.iter_all()* function:

```
>>> from scrapy.utils.trackref import iter_all
>>> [r.url for r in iter_all("HtmlResponse")]
['http://www.somenastyspider.com/product.php?pid=123',
'http://www.somenastyspider.com/product.php?pid=584',
...]
```

Too many spiders?

If your project has too many spiders executed in parallel, the output of `prefs()` can be difficult to read. For this reason, that function has a `ignore` argument which can be used to ignore a particular class (and all its subclasses). For example, this won't show any live references to spiders:

```
>>> from scrapy.spiders import Spider
>>> prefs(ignore=Spider)
```

scrapy.utils.trackref module

Here are the functions available in the *trackref* module.

class scrapy.utils.trackref.**object_ref**

Inherit from this class if you want to track live instances with the `trackref` module.

scrapy.utils.trackref.**print_live_refs**(*class_name*, *ignore=NoneType*)

Print a report of live references, grouped by class name.

Parameters

ignore (*type or tuple*) – if given, all objects from the specified class (or tuple of classes) will be ignored.

scrapy.utils.trackref.**get_oldest**(*class_name*)

Return the oldest object alive with the given class name, or `None` if none is found. Use *print_live_refs()* first to get a list of all tracked live objects per class name.

scrapy.utils.trackref.**iter_all**(*class_name*)

Return an iterator over all objects alive with the given class name, or `None` if none is found. Use *print_live_refs()* first to get a list of all tracked live objects per class name.

5.8.3 Debugging memory leaks with muppy

`trackref` provides a very convenient mechanism for tracking down memory leaks, but it only keeps track of the objects that are more likely to cause memory leaks. However, there are other cases where the memory leaks could come from other (more or less obscure) objects. If this is your case, and you can't find your leaks using `trackref`, you still have another resource: the muppy library.

You can use muppy from Pympler.

If you use `pip`, you can install muppy with the following command:

```
pip install Pympler
```

Here's an example to view all Python objects available in the heap using muppy:

```
>>> from pympler import muppy
>>> all_objects = muppy.get_objects()
>>> len(all_objects)
28667
>>> from pympler import summary
>>> suml = summary.summarize(all_objects)
>>> summary.print_(suml)
                                 types |   # objects |   total size
====================================== | =========== | ============
                        <class 'str |        9822 |      1.10 MB
                       <class 'dict |        1658 |    856.62 KB
                       <class 'type |         436 |    443.60 KB
                       <class 'code |        2974 |    419.56 KB
         <class '_io.BufferedWriter |           2 |    256.34 KB
                        <class 'set |         420 |    159.88 KB
         <class '_io.BufferedReader |           1 |    128.17 KB
         <class 'wrapper_descriptor |        1130 |     88.28 KB
                      <class 'tuple |        1304 |     86.57 KB
                     <class 'weakref |        1013 |     79.14 KB
  <class 'builtin_function_or_method |         958 |     67.36 KB
          <class 'method_descriptor |         865 |     60.82 KB
                <class 'abc.ABCMeta |          62 |     59.96 KB
                       <class 'list |         446 |     58.52 KB
                        <class 'int |        1425 |     43.20 KB
```

For more info about muppy, refer to the muppy documentation.

5.8.4 Leaks without leaks

Sometimes, you may notice that the memory usage of your Scrapy process will only increase, but never decrease. Unfortunately, this could happen even though neither Scrapy nor your project are leaking memory. This is due to a (not so well) known problem of Python, which may not return released memory to the operating system in some cases. For more information on this issue see:

- Python Memory Management
- Python Memory Management Part 2
- Python Memory Management Part 3

The improvements proposed by Evan Jones, which are detailed in this paper, got merged in Python 2.5, but this only reduces the problem, it doesn't fix it completely. To quote the paper:

> *Unfortunately, this patch can only free an arena if there are no more objects allocated in it anymore. This means that fragmentation is a large issue. An application could have many megabytes of free memory, scattered throughout all the arenas, but it will be unable to free any of it. This is a problem experienced by all memory allocators. The only way to solve it is to move to a compacting garbage collector, which is able to move objects in memory. This would require significant changes to the Python interpreter.*

To keep memory consumption reasonable you can split the job into several smaller jobs or enable *persistent job queue* and stop/start spider from time to time.

5.9 Downloading and processing files and images

Scrapy provides reusable *item pipelines* for downloading files attached to a particular item (for example, when you scrape products and also want to download their images locally). These pipelines share a bit of functionality and structure (we refer to them as media pipelines), but typically you'll either use the Files Pipeline or the Images Pipeline.

Both pipelines implement these features:

- Avoid re-downloading media that was downloaded recently
- Specifying where to store the media (filesystem directory, FTP server, Amazon S3 bucket, Google Cloud Storage bucket)

The Images Pipeline has a few extra functions for processing images:

- Convert all downloaded images to a common format (JPG) and mode (RGB)
- Thumbnail generation
- Check images width/height to make sure they meet a minimum constraint

The pipelines also keep an internal queue of those media URLs which are currently being scheduled for download, and connect those responses that arrive containing the same media to that queue. This avoids downloading the same media more than once when it's shared by several items.

5.9.1 Using the Files Pipeline

The typical workflow, when using the `FilesPipeline` goes like this:

1. In a Spider, you scrape an item and put the URLs of the desired into a `file_urls` field.
2. The item is returned from the spider and goes to the item pipeline.
3. When the item reaches the `FilesPipeline`, the URLs in the `file_urls` field are scheduled for download using the standard Scrapy scheduler and downloader (which means the scheduler and downloader middlewares are reused), but with a higher priority, processing them before other pages are scraped. The item remains "locked" at that particular pipeline stage until the files have finish downloading (or fail for some reason).

4. When the files are downloaded, another field (`files`) will be populated with the results. This field will contain a list of dicts with information about the downloaded files, such as the downloaded path, the original scraped url (taken from the `file_urls` field), the file checksum and the file status. The files in the list of the `files` field will retain the same order of the original `file_urls` field. If some file failed downloading, an error will be logged and the file won't be present in the `files` field.

5.9.2 Using the Images Pipeline

Using the *ImagesPipeline* is a lot like using the `FilesPipeline`, except the default field names used are different: you use `image_urls` for the image URLs of an item and it will populate an `images` field for the information about the downloaded images.

The advantage of using the *ImagesPipeline* for image files is that you can configure some extra functions like generating thumbnails and filtering the images based on their size.

The Images Pipeline requires Pillow 8.0.0 or greater. It is used for thumbnailing and normalizing images to JPEG/RGB format.

5.9.3 Enabling your Media Pipeline

To enable your media pipeline you must first add it to your project *ITEM_PIPELINES* setting.

For Images Pipeline, use:

```
ITEM_PIPELINES = {"scrapy.pipelines.images.ImagesPipeline": 1}
```

For Files Pipeline, use:

```
ITEM_PIPELINES = {"scrapy.pipelines.files.FilesPipeline": 1}
```

Note

You can also use both the Files and Images Pipeline at the same time.

Then, configure the target storage setting to a valid value that will be used for storing the downloaded images. Otherwise the pipeline will remain disabled, even if you include it in the *ITEM_PIPELINES* setting.

For the Files Pipeline, set the *FILES_STORE* setting:

```
FILES_STORE = "/path/to/valid/dir"
```

For the Images Pipeline, set the *IMAGES_STORE* setting:

```
IMAGES_STORE = "/path/to/valid/dir"
```

5.9.4 File Naming

Default File Naming

By default, files are stored using an SHA-1 hash of their URLs for the file names.

For example, the following image URL:

```
http://www.example.com/image.jpg
```

Whose `SHA-1 hash` is:

```
3afec3b4765f8f0a07b78f98c07b83f013567a0a
```

Will be downloaded and stored using your chosen *storage method* and the following file name:

```
3afec3b4765f8f0a07b78f98c07b83f013567a0a.jpg
```

Custom File Naming

You may wish to use a different calculated file name for saved files. For example, classifying an image by including meta in the file name.

Customize file names by overriding the `file_path` method of your media pipeline.

For example, an image pipeline with image URL:

```
http://www.example.com/product/images/large/front/0000000004166
```

Can be processed into a file name with a condensed hash and the perspective `front`:

```
00b08510e4_front.jpg
```

By overriding `file_path` like this:

```
import hashlib

def file_path(self, request, response=None, info=None, *, item=None):
    image_url_hash = hashlib.shake_256(request.url.encode()).hexdigest(5)
    image_perspective = request.url.split("/")[-2]
    image_filename = f"{image_url_hash}_{image_perspective}.jpg"

    return image_filename
```

Warning

If your custom file name scheme relies on meta data that can vary between scrapes it may lead to unexpected re-downloading of existing media using new file names.

For example, if your custom file name scheme uses a product title and the site changes an item's product title between scrapes, Scrapy will re-download the same media using updated file names.

For more information about the `file_path` method, see *Extending the Media Pipelines*.

5.9.5 Supported Storage

File system storage

File system storage will save files to the following path:

```
<IMAGES_STORE>/full/<FILE_NAME>
```

Where:

- `<IMAGES_STORE>` is the directory defined in *IMAGES_STORE* setting for the Images Pipeline.

- `full` is a sub-directory to separate full images from thumbnails (if used). For more info see *Thumbnail generation for images*.
- `<FILE_NAME>` is the file name assigned to the file. For more info see *File Naming*.

FTP server storage

Added in version 2.0.

FILES_STORE and *IMAGES_STORE* can point to an FTP server. Scrapy will automatically upload the files to the server.

FILES_STORE and *IMAGES_STORE* should be written in one of the following forms:

```
ftp://username:password@address:port/path
ftp://address:port/path
```

If `username` and `password` are not provided, they are taken from the *FTP_USER* and *FTP_PASSWORD* settings respectively.

FTP supports two different connection modes: active or passive. Scrapy uses the passive connection mode by default. To use the active connection mode instead, set the *FEED_STORAGE_FTP_ACTIVE* setting to `True`.

Amazon S3 storage

If botocore >= 1.4.87 is installed, *FILES_STORE* and *IMAGES_STORE* can represent an Amazon S3 bucket. Scrapy will automatically upload the files to the bucket.

For example, this is a valid *IMAGES_STORE* value:

```
IMAGES_STORE = "s3://bucket/images"
```

You can modify the Access Control List (ACL) policy used for the stored files, which is defined by the *FILES_STORE_S3_ACL* and *IMAGES_STORE_S3_ACL* settings. By default, the ACL is set to `private`. To make the files publicly available use the `public-read` policy:

```
IMAGES_STORE_S3_ACL = "public-read"
```

For more information, see canned ACLs in the Amazon S3 Developer Guide.

You can also use other S3-like storages. Storages like self-hosted Minio or Zenko CloudServer. All you need to do is set endpoint option in you Scrapy settings:

```
AWS_ENDPOINT_URL = "http://minio.example.com:9000"
```

For self-hosting you also might feel the need not to use SSL and not to verify SSL connection:

```
AWS_USE_SSL = False  # or True (None by default)
AWS_VERIFY = False  # or True (None by default)
```

Google Cloud Storage

FILES_STORE and *IMAGES_STORE* can represent a Google Cloud Storage bucket. Scrapy will automatically upload the files to the bucket. (requires google-cloud-storage)

For example, these are valid *IMAGES_STORE* and *GCS_PROJECT_ID* settings:

```
IMAGES_STORE = "gs://bucket/images/"
GCS_PROJECT_ID = "project_id"
```

For information about authentication, see this documentation.

You can modify the Access Control List (ACL) policy used for the stored files, which is defined by the *FILES_STORE_GCS_ACL* and *IMAGES_STORE_GCS_ACL* settings. By default, the ACL is set to `''` (empty string) which means that Cloud Storage applies the bucket's default object ACL to the object. To make the files publicly available use the `publicRead` policy:

```
IMAGES_STORE_GCS_ACL = "publicRead"
```

For more information, see Predefined ACLs in the Google Cloud Platform Developer Guide.

5.9.6 Usage example

In order to use a media pipeline, first *enable it*.

Then, if a spider returns an *item object* with the URLs field (`file_urls` or `image_urls`, for the Files or Images Pipeline respectively), the pipeline will put the results under the respective field (`files` or `images`).

When using *item types* for which fields are defined beforehand, you must define both the URLs field and the results field. For example, when using the images pipeline, items must define both the `image_urls` and the `images` field. For instance, using the *Item* class:

```
import scrapy

class MyItem(scrapy.Item):
    # ... other item fields ...
    image_urls = scrapy.Field()
    images = scrapy.Field()
```

If you want to use another field name for the URLs key or for the results key, it is also possible to override it.

For the Files Pipeline, set *FILES_URLS_FIELD* and/or *FILES_RESULT_FIELD* settings:

```
FILES_URLS_FIELD = "field_name_for_your_files_urls"
FILES_RESULT_FIELD = "field_name_for_your_processed_files"
```

For the Images Pipeline, set *IMAGES_URLS_FIELD* and/or *IMAGES_RESULT_FIELD* settings:

```
IMAGES_URLS_FIELD = "field_name_for_your_images_urls"
IMAGES_RESULT_FIELD = "field_name_for_your_processed_images"
```

If you need something more complex and want to override the custom pipeline behaviour, see *Extending the Media Pipelines*.

If you have multiple image pipelines inheriting from ImagePipeline and you want to have different settings in different pipelines you can set setting keys preceded with uppercase name of your pipeline class. E.g. if your pipeline is called MyPipeline and you want to have custom IMAGES_URLS_FIELD you define setting MYPIPELINE_IMAGES_URLS_FIELD and your custom settings will be used.

5.9.7 Additional features

File expiration

The Image Pipeline avoids downloading files that were downloaded recently. To adjust this retention delay use the *FILES_EXPIRES* setting (or *IMAGES_EXPIRES*, in case of Images Pipeline), which specifies the delay in number of days:

```
# 120 days of delay for files expiration
FILES_EXPIRES = 120

# 30 days of delay for images expiration
IMAGES_EXPIRES = 30
```

The default value for both settings is 90 days.

If you have pipeline that subclasses FilesPipeline and you'd like to have different setting for it you can set setting keys preceded by uppercase class name. E.g. given pipeline class called MyPipeline you can set setting key:

MYPIPELINE_FILES_EXPIRES = 180

and pipeline class MyPipeline will have expiration time set to 180.

The last modified time from the file is used to determine the age of the file in days, which is then compared to the set expiration time to determine if the file is expired.

Thumbnail generation for images

The Images Pipeline can automatically create thumbnails of the downloaded images. In order to use this feature, you must set *IMAGES_THUMBS* to a dictionary where the keys are the thumbnail names and the values are their dimensions.

For example:

```
IMAGES_THUMBS = {
    "small": (50, 50),
    "big": (270, 270),
}
```

When you use this feature, the Images Pipeline will create thumbnails of the each specified size with this format:

```
<IMAGES_STORE>/thumbs/<size_name>/<image_id>.jpg
```

Where:

- `<size_name>` is the one specified in the *IMAGES_THUMBS* dictionary keys (`small`, `big`, etc)
- `<image_id>` is the SHA-1 hash of the image url

Example of image files stored using `small` and `big` thumbnail names:

```
<IMAGES_STORE>/full/63bbfea82b8880ed33cdb762aa11fab722a90a24.jpg
<IMAGES_STORE>/thumbs/small/63bbfea82b8880ed33cdb762aa11fab722a90a24.jpg
<IMAGES_STORE>/thumbs/big/63bbfea82b8880ed33cdb762aa11fab722a90a24.jpg
```

The first one is the full image, as downloaded from the site.

Filtering out small images

When using the Images Pipeline, you can drop images which are too small, by specifying the minimum allowed size in the *IMAGES_MIN_HEIGHT* and *IMAGES_MIN_WIDTH* settings.

For example:

```
IMAGES_MIN_HEIGHT = 110
IMAGES_MIN_WIDTH = 110
```

> **Note**
>
> The size constraints don't affect thumbnail generation at all.

It is possible to set just one size constraint or both. When setting both of them, only images that satisfy both minimum sizes will be saved. For the above example, images of sizes (105 x 105) or (105 x 200) or (200 x 105) will all be dropped because at least one dimension is shorter than the constraint.

By default, there are no size constraints, so all images are processed.

Allowing redirections

By default media pipelines ignore redirects, i.e. an HTTP redirection to a media file URL request will mean the media download is considered failed.

To handle media redirections, set this setting to `True`:

```
MEDIA_ALLOW_REDIRECTS = True
```

5.9.8 Extending the Media Pipelines

See here the methods that you can override in your custom Files Pipeline:

class scrapy.pipelines.files.**FilesPipeline**

file_path(*self*, *request*, *response=None*, *info=None*, *, *item=None*)

This method is called once per downloaded item. It returns the download path of the file originating from the specified *response*.

In addition to `response`, this method receives the original *request*, `info` and *item*

You can override this method to customize the download path of each file.

For example, if file URLs end like regular paths (e.g. `https://example.com/a/b/c/foo.png`), you can use the following approach to download all files into the `files` folder with their original filenames (e.g. `files/foo.png`):

```
from pathlib import PurePosixPath
from scrapy.utils.httpobj import urlparse_cached

from scrapy.pipelines.files import FilesPipeline

class MyFilesPipeline(FilesPipeline):
    def file_path(self, request, response=None, info=None, *, item=None):
        return "files/" + PurePosixPath(urlparse_cached(request).path).name
```

Similarly, you can use the `item` to determine the file path based on some item property.

By default the *file_path()* method returns `full/<request URL hash>.<extension>`.

Added in version 2.4: The *item* parameter.

get_media_requests(*item*, *info*)

As seen on the workflow, the pipeline will get the URLs of the images to download from the item. In order to do this, you can override the *get_media_requests()* method and return a Request for each file URL:

```
from itemadapter import ItemAdapter

def get_media_requests(self, item, info):
    adapter = ItemAdapter(item)
    for file_url in adapter["file_urls"]:
        yield scrapy.Request(file_url)
```

Those requests will be processed by the pipeline and, when they have finished downloading, the results will be sent to the *item_completed()* method, as a list of 2-element tuples. Each tuple will contain `(success, file_info_or_error)` where:

- `success` is a boolean which is `True` if the image was downloaded successfully or `False` if it failed for some reason
- `file_info_or_error` is a dict containing the following keys (if success is `True`) or a `Failure` if there was a problem.
  - `url` - the url where the file was downloaded from. This is the url of the request returned from the *get_media_requests()* method.
  - `path` - the path (relative to *FILES_STORE*) where the file was stored
  - `checksum` - a MD5 hash of the image contents
  - `status` - the file status indication.

    Added in version 2.2.

    It can be one of the following:

    * `downloaded` - file was downloaded.
    * `uptodate` - file was not downloaded, as it was downloaded recently, according to the file expiration policy.
    * `cached` - file was already scheduled for download, by another item sharing the same file.

The list of tuples received by *item_completed()* is guaranteed to retain the same order of the requests returned from the *get_media_requests()* method.

Here's a typical value of the `results` argument:

```
[
    (
        True,
        {
            "checksum": "2b00042f7481c7b056c4b410d28f33cf",
            "path": "full/0a79c461a4062ac383dc4fade7bc09f1384a3910.jpg",
            "url": "http://www.example.com/files/product1.pdf",
            "status": "downloaded",
        },
    ),
    (False, Failure(...)),
]
```

By default the *get_media_requests()* method returns `None` which means there are no files to download for the item.

item_completed(*results*, *item*, *info*)

The *FilesPipeline.item_completed()* method called when all file requests for a single item have completed (either finished downloading, or failed for some reason).

The *item_completed()* method must return the output that will be sent to subsequent item pipeline stages, so you must return (or drop) the item, as you would in any pipeline.

Here is an example of the *item_completed()* method where we store the downloaded file paths (passed in results) in the `file_paths` item field, and we drop the item if it doesn't contain any files:

```
from itemadapter import ItemAdapter
from scrapy.exceptions import DropItem

def item_completed(self, results, item, info):
    file_paths = [x["path"] for ok, x in results if ok]
    if not file_paths:
        raise DropItem("Item contains no files")
    adapter = ItemAdapter(item)
    adapter["file_paths"] = file_paths
    return item
```

By default, the *item_completed()* method returns the item.

See here the methods that you can override in your custom Images Pipeline:

class scrapy.pipelines.images.**ImagesPipeline**

The *ImagesPipeline* is an extension of the `FilesPipeline`, customizing the field names and adding custom behavior for images.

file_path(*self*, *request*, *response=None*, *info=None*, *, *item=None*)

This method is called once per downloaded item. It returns the download path of the file originating from the specified *response*.

In addition to `response`, this method receives the original *request*, `info` and *item*

You can override this method to customize the download path of each file.

For example, if file URLs end like regular paths (e.g. `https://example.com/a/b/c/foo.png`), you can use the following approach to download all files into the `files` folder with their original filenames (e.g. `files/foo.png`):

```
from pathlib import PurePosixPath
from scrapy.utils.httpobj import urlparse_cached

from scrapy.pipelines.images import ImagesPipeline

class MyImagesPipeline(ImagesPipeline):
    def file_path(self, request, response=None, info=None, *, item=None):
        return "files/" + PurePosixPath(urlparse_cached(request).path).name
```

Similarly, you can use the `item` to determine the file path based on some item property.

By default the *file_path()* method returns `full/<request URL hash>.<extension>`.

Added in version 2.4: The *item* parameter.

thumb_path(*self*, *request*, *thumb_id*, *response=None*, *info=None*, *, *item=None*)

This method is called for every item of *IMAGES_THUMBS* per downloaded item. It returns the thumbnail download path of the image originating from the specified *response*.

In addition to `response`, this method receives the original *request*, `thumb_id`, `info` and *item*.

You can override this method to customize the thumbnail download path of each image. You can use the `item` to determine the file path based on some item property.

By default the *thumb_path()* method returns `thumbs/<size name>/<request URL hash>.<extension>`.

get_media_requests(*item*, *info*)

Works the same way as `FilesPipeline.get_media_requests()` method, but using a different field name for image urls.

Must return a Request for each image URL.

item_completed(*results*, *item*, *info*)

The *ImagesPipeline.item_completed()* method is called when all image requests for a single item have completed (either finished downloading, or failed for some reason).

Works the same way as `FilesPipeline.item_completed()` method, but using a different field names for storing image downloading results.

By default, the *item_completed()* method returns the item.

5.9.9 Custom Images pipeline example

Here is a full example of the Images Pipeline whose methods are exemplified above:

```
import scrapy
from itemadapter import ItemAdapter
from scrapy.exceptions import DropItem
from scrapy.pipelines.images import ImagesPipeline

class MyImagesPipeline(ImagesPipeline):
    def get_media_requests(self, item, info):
        for image_url in item["image_urls"]:
            yield scrapy.Request(image_url)

    def item_completed(self, results, item, info):
        image_paths = [x["path"] for ok, x in results if ok]
        if not image_paths:
            raise DropItem("Item contains no images")
        adapter = ItemAdapter(item)
        adapter["image_paths"] = image_paths
        return item
```

To enable your custom media pipeline component you must add its class import path to the *ITEM_PIPELINES* setting, like in the following example:

```
ITEM_PIPELINES = {"myproject.pipelines.MyImagesPipeline": 300}
```

5.10 Deploying Spiders

This section describes the different options you have for deploying your Scrapy spiders to run them on a regular basis. Running Scrapy spiders in your local machine is very convenient for the (early) development stage, but not so much when you need to execute long-running spiders or move spiders to run in production continuously. This is where the solutions for deploying Scrapy spiders come in.

Popular choices for deploying Scrapy spiders are:

- *Scrapyd* (open source)
- *Zyte Scrapy Cloud* (cloud-based)

5.10.1 Deploying to a Scrapyd Server

Scrapyd is an open source application to run Scrapy spiders. It provides a server with HTTP API, capable of running and monitoring Scrapy spiders.

To deploy spiders to Scrapyd, you can use the scrapyd-deploy tool provided by the scrapyd-client package. Please refer to the scrapyd-deploy documentation for more information.

Scrapyd is maintained by some of the Scrapy developers.

5.10.2 Deploying to Zyte Scrapy Cloud

Zyte Scrapy Cloud is a hosted, cloud-based service by Zyte, the company behind Scrapy.

Zyte Scrapy Cloud removes the need to setup and monitor servers and provides a nice UI to manage spiders and review scraped items, logs and stats.

To deploy spiders to Zyte Scrapy Cloud you can use the shub command line tool. Please refer to the Zyte Scrapy Cloud documentation for more information.

Zyte Scrapy Cloud is compatible with Scrapyd and one can switch between them as needed - the configuration is read from the `scrapy.cfg` file just like `scrapyd-deploy`.

5.11 AutoThrottle extension

This is an extension for automatically throttling crawling speed based on load of both the Scrapy server and the website you are crawling.

5.11.1 Design goals

1. be nicer to sites instead of using default download delay of zero
2. automatically adjust Scrapy to the optimum crawling speed, so the user doesn't have to tune the download delays to find the optimum one. The user only needs to specify the maximum concurrent requests it allows, and the extension does the rest.

5.11.2 How it works

Scrapy allows defining the concurrency and delay of different download slots, e.g. through the *DOWNLOAD_SLOTS* setting. By default requests are assigned to slots based on their URL domain, although it is possible to customize the download slot of any request.

The AutoThrottle extension adjusts the delay of each download slot dynamically, to make your spider send *AUTOTHROTTLE_TARGET_CONCURRENCY* concurrent requests on average to each remote website.

It uses download latency to compute the delays. The main idea is the following: if a server needs `latency` seconds to respond, a client should send a request each `latency/N` seconds to have `N` requests processed in parallel.

Instead of adjusting the delays one can just set a small fixed download delay and impose hard limits on concurrency using *CONCURRENT_REQUESTS_PER_DOMAIN* or *CONCURRENT_REQUESTS_PER_IP* options. It will provide a similar effect, but there are some important differences:

- because the download delay is small there will be occasional bursts of requests;
- often non-200 (error) responses can be returned faster than regular responses, so with a small download delay and a hard concurrency limit crawler will be sending requests to server faster when server starts to return errors. But this is an opposite of what crawler should do - in case of errors it makes more sense to slow down: these errors may be caused by the high request rate.

AutoThrottle doesn't have these issues.

5.11.3 Throttling algorithm

AutoThrottle algorithm adjusts download delays based on the following rules:

1. spiders always start with a download delay of *AUTOTHROTTLE_START_DELAY*;
2. when a response is received, the target download delay is calculated as `latency / N` where `latency` is a latency of the response, and `N` is *AUTOTHROTTLE_TARGET_CONCURRENCY*.
3. download delay for next requests is set to the average of previous download delay and the target download delay;
4. latencies of non-200 responses are not allowed to decrease the delay;
5. download delay can't become less than *DOWNLOAD_DELAY* or greater than *AUTOTHROTTLE_MAX_DELAY*

> **Note**
>
> The AutoThrottle extension honours the standard Scrapy settings for concurrency and delay. This means that it will respect *CONCURRENT_REQUESTS_PER_DOMAIN* and *CONCURRENT_REQUESTS_PER_IP* options and never set a download delay lower than *DOWNLOAD_DELAY*.

In Scrapy, the download latency is measured as the time elapsed between establishing the TCP connection and receiving the HTTP headers.

Note that these latencies are very hard to measure accurately in a cooperative multitasking environment because Scrapy may be busy processing a spider callback, for example, and unable to attend downloads. However, these latencies should still give a reasonable estimate of how busy Scrapy (and ultimately, the server) is, and this extension builds on that premise.

5.11.4 Prevent specific requests from triggering slot delay adjustments

AutoThrottle adjusts the delay of download slots based on the latencies of responses that belong to that download slot. The only exceptions are non-200 responses, which are only taken into account to increase that delay, but ignored if they would decrease that delay.

You can also set the `autothrottle_dont_adjust_delay` request metadata key to `True` in any request to prevent its response latency from impacting the delay of its download slot:

```
from scrapy import Request

Request("https://example.com", meta={"autothrottle_dont_adjust_delay": True})
```

Note, however, that AutoThrottle still determines the starting delay of every download slot by setting the `download_delay` attribute on the running spider. If you want AutoThrottle not to impact a download slot at all, in addition to setting this meta key in all requests that use that download slot, you might want to set a custom value for the `delay` attribute of that download slot, e.g. using *DOWNLOAD_SLOTS*.

5.11.5 Settings

The settings used to control the AutoThrottle extension are:

- *AUTOTHROTTLE_ENABLED*
- *AUTOTHROTTLE_START_DELAY*
- *AUTOTHROTTLE_MAX_DELAY*
- *AUTOTHROTTLE_TARGET_CONCURRENCY*
- *AUTOTHROTTLE_DEBUG*
- *CONCURRENT_REQUESTS_PER_DOMAIN*
- *CONCURRENT_REQUESTS_PER_IP*
- *DOWNLOAD_DELAY*

For more information see *How it works*.

AUTOTHROTTLE_ENABLED

Default: `False`

Enables the AutoThrottle extension.

AUTOTHROTTLE_START_DELAY

Default: `5.0`

The initial download delay (in seconds).

AUTOTHROTTLE_MAX_DELAY

Default: `60.0`

The maximum download delay (in seconds) to be set in case of high latencies.

AUTOTHROTTLE_TARGET_CONCURRENCY

Default: `1.0`

Average number of requests Scrapy should be sending in parallel to remote websites. It must be higher than `0.0`.

By default, AutoThrottle adjusts the delay to send a single concurrent request to each of the remote websites. Set this option to a higher value (e.g. `2.0`) to increase the throughput and the load on remote servers. A lower `AUTOTHROTTLE_TARGET_CONCURRENCY` value (e.g. `0.5`) makes the crawler more conservative and polite.

Note that *CONCURRENT_REQUESTS_PER_DOMAIN* and *CONCURRENT_REQUESTS_PER_IP* options are still respected when AutoThrottle extension is enabled. This means that if `AUTOTHROTTLE_TARGET_CONCURRENCY` is set to a value higher than *CONCURRENT_REQUESTS_PER_DOMAIN* or *CONCURRENT_REQUESTS_PER_IP*, the crawler won't reach this number of concurrent requests.

At every given time point Scrapy can be sending more or less concurrent requests than `AUTOTHROTTLE_TARGET_CONCURRENCY`; it is a suggested value the crawler tries to approach, not a hard limit.

AUTOTHROTTLE_DEBUG

Default: `False`

Enable AutoThrottle debug mode which will display stats on every response received, so you can see how the throttling parameters are being adjusted in real time.

5.12 Benchmarking

Scrapy comes with a simple benchmarking suite that spawns a local HTTP server and crawls it at the maximum possible speed. The goal of this benchmarking is to get an idea of how Scrapy performs in your hardware, in order to have a common baseline for comparisons. It uses a simple spider that does nothing and just follows links.

To run it use:

```
scrapy bench
```

You should see an output like this:

```
2016-12-16 21:18:48 [scrapy.utils.log] INFO: Scrapy 1.2.2 started (bot: quotesbot)
2016-12-16 21:18:48 [scrapy.utils.log] INFO: Overridden settings: {'CLOSESPIDER_TIMEOUT

2016-12-16 21:19:00 [scrapy.core.engine] INFO: Spider closed (closespider_timeout)
```

That tells you that Scrapy is able to crawl about 3000 pages per minute in the hardware where you run it. Note that this is a very simple spider intended to follow links, any custom spider you write will probably do more stuff which results in slower crawl rates. How slower depends on how much your spider does and how well it's written.

Use scrapy-bench for more complex benchmarking.

5.13 Jobs: pausing and resuming crawls

Sometimes, for big sites, it's desirable to pause crawls and be able to resume them later.

Scrapy supports this functionality out of the box by providing the following facilities:

- a scheduler that persists scheduled requests on disk
- a duplicates filter that persists visited requests on disk
- an extension that keeps some spider state (key/value pairs) persistent between batches

5.13.1 Job directory

To enable persistence support you just need to define a *job directory* through the `JOBDIR` setting. This directory will be for storing all required data to keep the state of a single job (i.e. a spider run). It's important to note that this directory must not be shared by different spiders, or even different jobs/runs of the same spider, as it's meant to be used for storing the state of a *single* job.

5.13.2 How to use it

To start a spider with persistence support enabled, run it like this:

```
scrapy crawl somespider -s JOBDIR=crawls/somespider-1
```

Then, you can stop the spider safely at any time (by pressing Ctrl-C or sending a signal), and resume it later by issuing the same command:

```
scrapy crawl somespider -s JOBDIR=crawls/somespider-1
```

5.13.3 Keeping persistent state between batches

Sometimes you'll want to keep some persistent spider state between pause/resume batches. You can use the `spider.state` attribute for that, which should be a dict. There's *a built-in extension* that takes care of serializing, storing and loading that attribute from the job directory, when the spider starts and stops.

Here's an example of a callback that uses the spider state (other spider code is omitted for brevity):

```
def parse_item(self, response):
    # parse item here
    self.state["items_count"] = self.state.get("items_count", 0) + 1
```

5.13.4 Persistence gotchas

There are a few things to keep in mind if you want to be able to use the Scrapy persistence support:

Cookies expiration

Cookies may expire. So, if you don't resume your spider quickly the requests scheduled may no longer work. This won't be an issue if your spider doesn't rely on cookies.

Request serialization

For persistence to work, *`Request`* objects must be serializable with `pickle`, except for the `callback` and `errback` values passed to their `__init__` method, which must be methods of the running *`Spider`* class.

If you wish to log the requests that couldn't be serialized, you can set the *`SCHEDULER_DEBUG`* setting to `True` in the project's settings page. It is `False` by default.

5.14 Coroutines

Added in version 2.0.

Scrapy *supports* the coroutine syntax (i.e. `async def`).

5.14.1 Supported callables

The following callables may be defined as coroutines using `async def`, and hence use coroutine syntax (e.g. `await`, `async for`, `async with`):

- The `start()` spider method, which *must* be defined as an asynchronous generator.

  Added in version 2.13.

- *`Request`* callbacks.

  If you are using any custom or third-party *spider middleware*, see *Mixing synchronous and asynchronous spider middlewares*.

  Changed in version 2.7: Output of async callbacks is now processed asynchronously instead of collecting all of it first.

- The *`process_item()`* method of *item pipelines*.

- The *`process_request()`*, *`process_response()`*, and *`process_exception()`* methods of *downloader middlewares*.

- The *`process_spider_output()`* method of *spider middlewares*.

  If defined as a coroutine, it must be an asynchronous generator. The input `result` parameter is an asynchronous iterable.

  See also *Mixing synchronous and asynchronous spider middlewares* and *Universal spider middlewares*.

  Added in version 2.7.

- The *`process_start()`* method of *spider middlewares*, which *must* be defined as an asynchronous generator.

  Added in version 2.13.

- *Signal handlers that support deferreds*.

5.14.2 Using Deferred-based APIs

In addition to native coroutine APIs Scrapy has some APIs that return a `Deferred` object or take a user-supplied function that returns a `Deferred` object. These APIs are also asynchronous but don't yet support native `async def` syntax. In the future we plan to add support for the `async def` syntax to these APIs or replace them with other APIs where changing the existing ones is possible.

The following Scrapy methods return `Deferred` objects (this list is not complete as it only includes methods that we think may be useful for user code):

- *`scrapy.crawler.Crawler`*:
  - *`crawl()`*
  - *`stop()`*
- *`scrapy.crawler.CrawlerRunner`* (also inherited by *`scrapy.crawler.CrawlerProcess`*):
  - *`crawl()`*
  - *`stop()`*
  - *`join()`*
- *`scrapy.core.engine.ExecutionEngine`*:
  - `download()`
- *`scrapy.signalmanager.SignalManager`*:

  - *send_catch_log_deferred()*
- *MailSender*
  - *send()*

The following user-supplied methods can return Deferred objects (the methods that can also return coroutines are listed in *Supported callables*):

- Custom download handlers (see *DOWNLOAD_HANDLERS*):
  - download_request()
  - close()
- Custom downloader implementations (see *DOWNLOADER*):
  - fetch()
- Custom scheduler implementations (see *SCHEDULER*):
  - *open()*
  - *close()*
- Custom dupefilters (see *DUPEFILTER_CLASS*):
  - open()
  - close()
- Custom feed storages (see *FEED_STORAGES*):
  - store()
- Subclasses of scrapy.pipelines.media.MediaPipeline:
  - media_to_download()
  - item_completed()
- Custom storages used by subclasses of *scrapy.pipelines.files.FilesPipeline*:
  - persist_file()
  - stat_file()

In most cases you can use these APIs in code that otherwise uses coroutines, by wrapping a Deferred object into a Future object or vice versa. See *Integrating Deferred code and asyncio code* for more information about this.

For example:

- The ExecutionEngine.download() method returns a Deferred object that fires with the downloaded response. You can use this object directly in Deferred-based code or convert it into a Future object with *maybe_deferred_to_future()*.
- A custom download handler needs to define a download_request() method that returns a Deferred object. You can write a method that works with Deferreds and returns one directly, or you can write a coroutine and convert it into a function that returns a Deferred with *deferred_f_from_coro_f()*.

5.14.3 General usage

There are several use cases for coroutines in Scrapy.

Code that would return Deferreds when written for previous Scrapy versions, such as downloader middlewares and signal handlers, can be rewritten to be shorter and cleaner:

```
from itemadapter import ItemAdapter

class DbPipeline:
    def _update_item(self, data, item):
        adapter = ItemAdapter(item)
        adapter["field"] = data
        return item

    def process_item(self, item, spider):
        adapter = ItemAdapter(item)
        dfd = db.get_some_data(adapter["id"])
        dfd.addCallback(self._update_item, item)
        return dfd
```

becomes:

```
from itemadapter import ItemAdapter

class DbPipeline:
    async def process_item(self, item, spider):
        adapter = ItemAdapter(item)
        adapter["field"] = await db.get_some_data(adapter["id"])
        return item
```

Coroutines may be used to call asynchronous code. This includes other coroutines, functions that return Deferreds and functions that return awaitable objects such as `Future`. This means you can use many useful Python libraries providing such code:

```
class MySpiderDeferred(Spider):
    # ...
    async def parse(self, response):
        additional_response = await treq.get("https://additional.url")
        additional_data = await treq.content(additional_response)
        # ... use response and additional_data to yield items and requests

class MySpiderAsyncio(Spider):
    # ...
    async def parse(self, response):
        async with aiohttp.ClientSession() as session:
            async with session.get("https://additional.url") as additional_response:
                additional_data = await additional_response.text()
        # ... use response and additional_data to yield items and requests
```

Note

Many libraries that use coroutines, such as aio-libs, require the `asyncio` loop and to use them you need to *enable asyncio support in Scrapy*.

> **Note**
>
> If you want to `await` on Deferreds while using the asyncio reactor, you need to *wrap them*.

Common use cases for asynchronous code include:

- requesting data from websites, databases and other services (in `start()`, callbacks, pipelines and middlewares);
- storing data in databases (in pipelines and middlewares);
- delaying the spider initialization until some external event (in the *spider_opened* handler);
- calling asynchronous Scrapy methods like `ExecutionEngine.download()` (see *the screenshot pipeline example*).

5.14.4 Inline requests

The spider below shows how to send a request and await its response all from within a spider callback:

```
from scrapy import Spider, Request
from scrapy.utils.defer import maybe_deferred_to_future

class SingleRequestSpider(Spider):
    name = "single"
    start_urls = ["https://example.org/product"]

    async def parse(self, response, **kwargs):
        additional_request = Request("https://example.org/price")
        deferred = self.crawler.engine.download(additional_request)
        additional_response = await maybe_deferred_to_future(deferred)
        yield {
            "h1": response.css("h1").get(),
            "price": additional_response.css("#price").get(),
        }
```

You can also send multiple requests in parallel:

```
from scrapy import Spider, Request
from scrapy.utils.defer import maybe_deferred_to_future
from twisted.internet.defer import DeferredList

class MultipleRequestsSpider(Spider):
    name = "multiple"
    start_urls = ["https://example.com/product"]

    async def parse(self, response, **kwargs):
        additional_requests = [
            Request("https://example.com/price"),
            Request("https://example.com/color"),
        ]
        deferreds = []
        for r in additional_requests:
            deferred = self.crawler.engine.download(r)
```

(continues on next page)

(continued from previous page)

```
            deferreds.append(deferred)
        responses = await maybe_deferred_to_future(DeferredList(deferreds))
        yield {
            "h1": response.css("h1::text").get(),
            "price": responses[0][1].css(".price::text").get(),
            "price2": responses[1][1].css(".color::text").get(),
        }
```

5.14.5 Mixing synchronous and asynchronous spider middlewares

Added in version 2.7.

The output of a `Request` callback is passed as the `result` parameter to the *`process_spider_output()`* method of the first *spider middleware* from the *list of active spider middlewares*. Then the output of that `process_spider_output` method is passed to the `process_spider_output` method of the next spider middleware, and so on for every active spider middleware.

Scrapy supports mixing coroutine methods and synchronous methods in this chain of calls.

However, if any of the `process_spider_output` methods is defined as a synchronous method, and the previous `Request` callback or `process_spider_output` method is a coroutine, there are some drawbacks to the asynchronous-to-synchronous conversion that Scrapy does so that the synchronous `process_spider_output` method gets a synchronous iterable as its `result` parameter:

- The whole output of the previous `Request` callback or `process_spider_output` method is awaited at this point.
- If an exception raises while awaiting the output of the previous `Request` callback or `process_spider_output` method, none of that output will be processed.

  This contrasts with the regular behavior, where all items yielded before an exception raises are processed.

Asynchronous-to-synchronous conversions are supported for backward compatibility, but they are deprecated and will stop working in a future version of Scrapy.

To avoid asynchronous-to-synchronous conversions, when defining `Request` callbacks as coroutine methods or when using spider middlewares whose `process_spider_output` method is an asynchronous generator, all active spider middlewares must either have their `process_spider_output` method defined as an asynchronous generator or *define a process_spider_output_async method*.

For middleware users

If you have asynchronous callbacks or use asynchronous-only spider middlewares you should make sure the asynchronous-to-synchronous conversions *described above* don't happen. To do this, make sure all spider middlewares you use support asynchronous spider output. Even if you don't have asynchronous callbacks and don't use asynchronous-only spider middlewares in your project, it's still a good idea to make sure all middlewares you use support asynchronous spider output, so that it will be easy to start using asynchronous callbacks in the future. Because of this, Scrapy logs a warning when it detects a synchronous-only spider middleware.

If you want to update middlewares you wrote, see the *following section*. If you have 3rd-party middlewares that aren't yet updated by their authors, you can subclass them to make them *universal* and use the subclasses in your projects.

For middleware authors

If you have a spider middleware that defines a synchronous `process_spider_output` method, you should update it to support asynchronous spider output for *better compatibility*, even if you don't yet use it with asynchronous callbacks, especially if you publish this middleware for other people to use. You have two options for this:

1. Make the middleware asynchronous, by making the `process_spider_output` method an asynchronous generator.
2. Make the middleware universal, as described in the *next section*.

If your middleware won't be used in projects with synchronous-only middlewares, e.g. because it's an internal middleware and you know that all other middlewares in your projects are already updated, it's safe to choose the first option. Otherwise, it's better to choose the second option.

Universal spider middlewares

Added in version 2.7.

To allow writing a spider middleware that supports asynchronous execution of its `process_spider_output` method in Scrapy 2.7 and later (avoiding *asynchronous-to-synchronous conversions*) while maintaining support for older Scrapy versions, you may define `process_spider_output` as a synchronous method and define an asynchronous generator version of that method with an alternative name: `process_spider_output_async`.

For example:

```
class UniversalSpiderMiddleware:
    def process_spider_output(self, response, result, spider):
        for r in result:
            # ... do something with r
            yield r

    async def process_spider_output_async(self, response, result, spider):
        async for r in result:
            # ... do something with r
            yield r
```

Note

This is an interim measure to allow, for a time, to write code that works in Scrapy 2.7 and later without requiring asynchronous-to-synchronous conversions, and works in earlier Scrapy versions as well.

In some future version of Scrapy, however, this feature will be deprecated and, eventually, in a later version of Scrapy, this feature will be removed, and all spider middlewares will be expected to define their `process_spider_output` method as an asynchronous generator.

Since 2.13.0, Scrapy provides a base class, *BaseSpiderMiddleware*, which implements the `process_spider_output()` and `process_spider_output_async()` methods, so instead of duplicating the processing code you can override the `get_processed_request()` and/or the `get_processed_item()` method.

5.15 asyncio

Added in version 2.0.

Scrapy has partial support for `asyncio`. After you *install the asyncio reactor*, you may use `asyncio` and `asyncio`-powered libraries in any *coroutine*.

5.15.1 Installing the asyncio reactor

To enable `asyncio` support, your *`TWISTED_REACTOR`* setting needs to be set to `'twisted.internet.asyncioreactor.AsyncioSelectorReactor'`, which is the default value.

If you are using *`CrawlerRunner`*, you also need to install the `AsyncioSelectorReactor` reactor manually. You can do that using *`install_reactor()`*:

```
install_reactor("twisted.internet.asyncioreactor.AsyncioSelectorReactor")
```

5.15.2 Handling a pre-installed reactor

`twisted.internet.reactor` and some other Twisted imports install the default Twisted reactor as a side effect. Once a Twisted reactor is installed, it is not possible to switch to a different reactor at run time.

If you *configure the asyncio Twisted reactor* and, at run time, Scrapy complains that a different reactor is already installed, chances are you have some such imports in your code.

You can usually fix the issue by moving those offending module-level Twisted imports to the method or function definitions where they are used. For example, if you have something like:

```
from twisted.internet import reactor

def my_function():
    reactor.callLater(...)
```

Switch to something like:

```
def my_function():
    from twisted.internet import reactor

    reactor.callLater(...)
```

Alternatively, you can try to *manually install the asyncio reactor*, with *`install_reactor()`*, before those imports happen.

5.15.3 Integrating Deferred code and asyncio code

Coroutine functions can await on Deferreds by wrapping them into `asyncio.Future` objects. Scrapy provides two helpers for this:

`scrapy.utils.defer.`**`deferred_to_future`**(*d: Deferred[_T]*) → Future[_T]

Added in version 2.6.0.

Return an `asyncio.Future` object that wraps *d*.

When *using the asyncio reactor*, you cannot await on `Deferred` objects from *Scrapy callables defined as coroutines*, you can only await on `Future` objects. Wrapping `Deferred` objects into `Future` objects allows you to wait on them:

```
class MySpider(Spider):
    ...
    async def parse(self, response):
        additional_request = scrapy.Request('https://example.org/price')
        deferred = self.crawler.engine.download(additional_request)
        additional_response = await deferred_to_future(deferred)
```

scrapy.utils.defer.**maybe_deferred_to_future**(*d: Deferred[_T]*) → Deferred[_T] | Future[_T]

Added in version 2.6.0.

Return *d* as an object that can be awaited from a *Scrapy callable defined as a coroutine*.

What you can await in Scrapy callables defined as coroutines depends on the value of *TWISTED_REACTOR*:

- When *using the asyncio reactor*, you can only await on `asyncio.Future` objects.
- When not using the asyncio reactor, you can only await on `Deferred` objects.

If you want to write code that uses `Deferred` objects but works with any reactor, use this function on all `Deferred` objects:

```
class MySpider(Spider):
    ...
    async def parse(self, response):
        additional_request = scrapy.Request('https://example.org/price')
        deferred = self.crawler.engine.download(additional_request)
        additional_response = await maybe_deferred_to_future(deferred)
```

Tip

If you don't need to support reactors other than the default `AsyncioSelectorReactor`, you can use *deferred_to_future()*, otherwise you should use *maybe_deferred_to_future()*.

Tip

If you need to use these functions in code that aims to be compatible with lower versions of Scrapy that do not provide these functions, down to Scrapy 2.0 (earlier versions do not support `asyncio`), you can copy the implementation of these functions into your own code.

Coroutines and futures can be wrapped into Deferreds (for example, when a Scrapy API requires passing a Deferred to it) using the following helpers:

scrapy.utils.defer.**deferred_from_coro**(*o: _CT*) → Deferred

scrapy.utils.defer.**deferred_from_coro**(*o: _T*) → _T

Converts a coroutine or other awaitable object into a Deferred, or returns the object as is if it isn't a coroutine.

scrapy.utils.defer.**deferred_f_from_coro_f**(*coro_f: Callable[_P, Coroutine[Any, Any, _T]]*) → Callable[_P, Deferred[_T]]

Converts a coroutine function into a function that returns a Deferred.

The coroutine function will be called at the time when the wrapper is called. Wrapper args will be passed to it. This is useful for callback chains, as callback functions are called with the previous callback result.

5.15.4 Enforcing asyncio as a requirement

If you are writing a *component* that requires asyncio to work, use *scrapy.utils.reactor.is_asyncio_reactor_installed()* to *enforce it as a requirement*. For example:

```
from scrapy.utils.reactor import is_asyncio_reactor_installed
```

(continues on next page)

(continued from previous page)

```
class MyComponent:
    def __init__(self):
        if not is_asyncio_reactor_installed():
            raise ValueError(
                f"{MyComponent.__qualname__} requires the asyncio Twisted "
                f"reactor. Make sure you have it configured in the "
                f"TWISTED_REACTOR setting. See the asyncio documentation "
                f"of Scrapy for more information."
            )
```

scrapy.utils.reactor.**is_asyncio_reactor_installed**() → bool

Check whether the installed reactor is `AsyncioSelectorReactor`.

Raise a `RuntimeError` if no reactor is installed.

Changed in version 2.13: In earlier Scrapy versions this function silently installed the default reactor if there was no reactor installed. Now it raises an exception to prevent silent problems in this case.

5.15.5 Windows-specific notes

The Windows implementation of `asyncio` can use two event loop implementations, `ProactorEventLoop` (default) and `SelectorEventLoop`. However, only `SelectorEventLoop` works with Twisted.

Scrapy changes the event loop class to `SelectorEventLoop` automatically when you change the *TWISTED_REACTOR* setting or call *install_reactor()*.

Note

Other libraries you use may require `ProactorEventLoop`, e.g. because it supports subprocesses (this is the case with playwright), so you cannot use them together with Scrapy on Windows (but you should be able to use them on WSL or native Linux).

5.15.6 Using custom asyncio loops

You can also use custom asyncio event loops with the asyncio reactor. Set the *ASYNCIO_EVENT_LOOP* setting to the import path of the desired event loop class to use it instead of the default asyncio event loop.

5.15.7 Switching to a non-asyncio reactor

If for some reason your code doesn't work with the asyncio reactor, you can use a different reactor by setting the *TWISTED_REACTOR* setting to its import path (e.g. `'twisted.internet.epollreactor.EPollReactor'`) or to `None`, which will use the default reactor for your platform.

EXTENDING SCRAPY

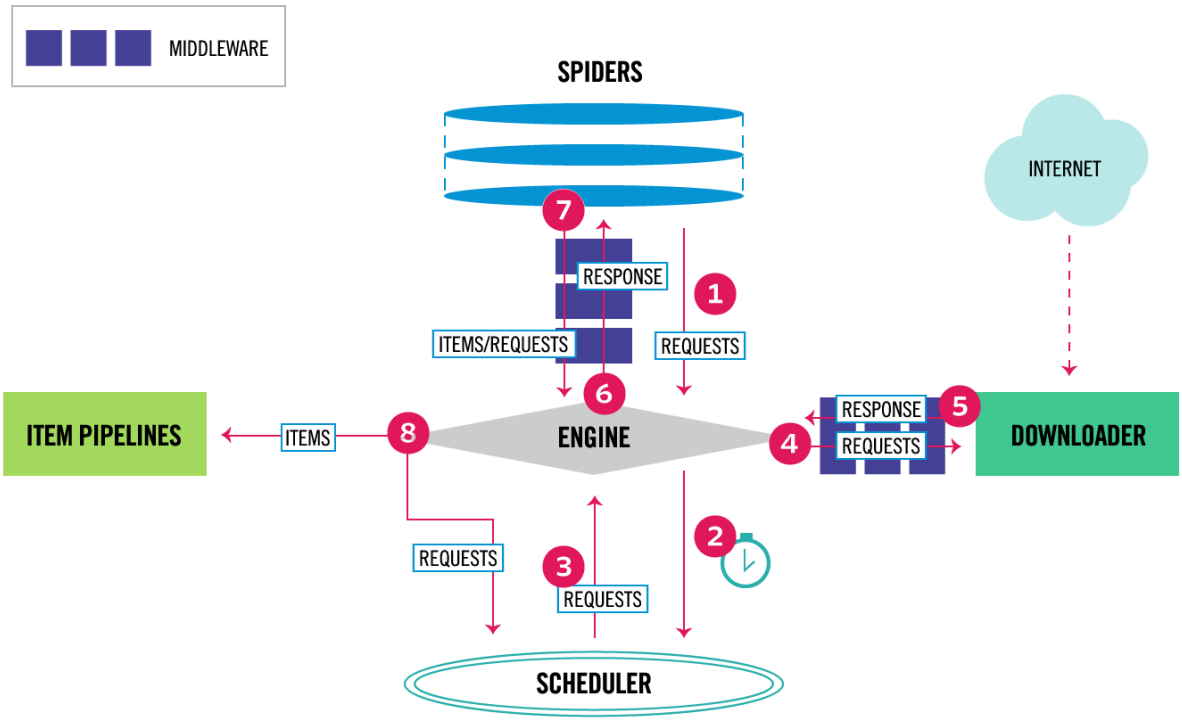
6.1 Architecture overview

This document describes the architecture of Scrapy and how its components interact.

6.1.1 Overview

The following diagram shows an overview of the Scrapy architecture with its components and an outline of the data flow that takes place inside the system (shown by the red arrows). A brief description of the components is included below with links for more detailed information about them. The data flow is also described below.

6.1.2 Data flow



The data flow in Scrapy is controlled by the execution engine, and goes like this:

1. The *Engine* gets the initial Requests to crawl from the *Spider*.
2. The *Engine* schedules the Requests in the *Scheduler* and asks for the next Requests to crawl.
3. The *Scheduler* returns the next Requests to the *Engine*.
4. The *Engine* sends the Requests to the *Downloader*, passing through the *Downloader Middlewares* (see `process_request()`).
5. Once the page finishes downloading the *Downloader* generates a Response (with that page) and sends it to the Engine, passing through the *Downloader Middlewares* (see `process_response()`).
6. The *Engine* receives the Response from the *Downloader* and sends it to the *Spider* for processing, passing through the *Spider Middleware* (see `process_spider_input()`).
7. The *Spider* processes the Response and returns scraped items and new Requests (to follow) to the *Engine*, passing through the *Spider Middleware* (see `process_spider_output()`).
8. The *Engine* sends processed items to *Item Pipelines*, then send processed Requests to the *Scheduler* and asks for possible next Requests to crawl.
9. The process repeats (from step 3) until there are no more requests from the *Scheduler*.

6.1.3 Components

Scrapy Engine

The engine is responsible for controlling the data flow between all components of the system, and triggering events when certain actions occur. See the *Data Flow* section above for more details.

Scheduler

The *scheduler* receives requests from the engine and enqueues them for feeding them later (also to the engine) when the engine requests them.

Downloader

The Downloader is responsible for fetching web pages and feeding them to the engine which, in turn, feeds them to the spiders.

Spiders

Spiders are custom classes written by Scrapy users to parse responses and extract *items* from them or additional requests to follow. For more information see *Spiders*.

Item Pipeline

The Item Pipeline is responsible for processing the items once they have been extracted (or scraped) by the spiders. Typical tasks include cleansing, validation and persistence (like storing the item in a database). For more information see *Item Pipeline*.

Downloader middlewares

Downloader middlewares are specific hooks that sit between the Engine and the Downloader and process requests when they pass from the Engine to the Downloader, and responses that pass from Downloader to the Engine.

Use a Downloader middleware if you need to do one of the following:

- process a request just before it is sent to the Downloader (i.e. right before Scrapy sends the request to the website);
- change received response before passing it to a spider;

- send a new Request instead of passing received response to a spider;
- pass response to a spider without fetching a web page;
- silently drop some requests.

For more information see *Downloader Middleware*.

Spider middlewares

Spider middlewares are specific hooks that sit between the Engine and the Spiders and are able to process spider input (responses) and output (items and requests).

Use a Spider middleware if you need to

- post-process output of spider callbacks - change/add/remove requests or items;
- post-process start requests or items;
- handle spider exceptions;
- call errback instead of callback for some of the requests based on response content.

For more information see *Spider Middleware*.

6.1.4 Event-driven networking

Scrapy is written with Twisted, a popular event-driven networking framework for Python. Thus, it's implemented using a non-blocking (aka asynchronous) code for concurrency.

For more information about asynchronous programming and Twisted see these links:

- Introduction to Deferreds
- Twisted Introduction - Krondo

6.2 Add-ons

Scrapy's add-on system is a framework which unifies managing and configuring components that extend Scrapy's core functionality, such as middlewares, extensions, or pipelines. It provides users with a plug-and-play experience in Scrapy extension management, and grants extensive configuration control to developers.

6.2.1 Activating and configuring add-ons

During `Crawler` initialization, the list of enabled add-ons is read from your `ADDONS` setting.

The `ADDONS` setting is a dict in which every key is an add-on class or its import path and the value is its priority.

This is an example where two add-ons are enabled in a project's `settings.py`:

```
ADDONS = {
    'path.to.someaddon': 0,
    SomeAddonClass: 1,
}
```

6.2.2 Writing your own add-ons

Add-ons are *components* that include one or both of the following methods:

update_settings(*settings*)

This method is called during the initialization of the *Crawler*. Here, you should perform dependency checks (e.g. for external Python libraries) and update the *Settings* object as wished, e.g. enable components for this add-on or set required configuration of other extensions.

Parameters
settings (*Settings*) – The settings object storing Scrapy/component configuration

classmethod update_pre_crawler_settings(*cls*, *settings*)

Use this class method instead of the *update_settings()* method to update *pre-crawler settings* whose value is used before the *Crawler* object is created.

Parameters
settings (*BaseSettings*) – The settings object storing Scrapy/component configuration

The settings set by the add-on should use the `addon` priority (see *Populating the settings* and *scrapy.settings.BaseSettings.set()*):

```
class MyAddon:
    def update_settings(self, settings):
        settings.set("DNSCACHE_ENABLED", True, "addon")
```

This allows users to override these settings in the project or spider configuration.

When editing the value of a setting instead of overriding it entirely, it is usually best to leave its priority unchanged. For example, when editing a *component priority dictionary*.

If the `update_settings` method raises *scrapy.exceptions.NotConfigured*, the add-on will be skipped. This makes it easy to enable an add-on only when some conditions are met.

Fallbacks

Some components provided by add-ons need to fall back to "default" implementations, e.g. a custom download handler needs to send the request that it doesn't handle via the default download handler, or a stats collector that includes some additional processing but otherwise uses the default stats collector. And it's possible that a project needs to use several custom components of the same type, e.g. two custom download handlers that support different kinds of custom requests and still need to use the default download handler for other requests. To make such use cases easier to configure, we recommend that such custom components should be written in the following way:

1. The custom component (e.g. `MyDownloadHandler`) shouldn't inherit from the default Scrapy one (e.g. `scrapy.core.downloader.handlers.http.HTTPDownloadHandler`), but instead be able to load the class of the fallback component from a special setting (e.g. `MY_FALLBACK_DOWNLOAD_HANDLER`), create an instance of it and use it.
2. The add-ons that include these components should read the current value of the default setting (e.g. `DOWNLOAD_HANDLERS`) in their `update_settings()` methods, save that value into the fallback setting (`MY_FALLBACK_DOWNLOAD_HANDLER` mentioned earlier) and set the default setting to the component provided by the add-on (e.g. `MyDownloadHandler`). If the fallback setting is already set by the user, they shouldn't change it.
3. This way, if there are several add-ons that want to modify the same setting, all of them will fallback to the component from the previous one and then to the Scrapy default. The order of that depends on the priority order in the `ADDONS` setting.

6.2.3 Add-on examples

Set some basic configuration:

```
from myproject.pipelines import MyPipeline

class MyAddon:
    def update_settings(self, settings):
        settings.set("DNSCACHE_ENABLED", True, "addon")
        settings.remove_from_list("METAREFRESH_IGNORE_TAGS", "noscript")
        settings.setdefault_in_component_priority_dict(
            "ITEM_PIPELINES", MyPipeline, 200
        )
```

Tip

When editing a *component priority dictionary* setting, like *ITEM_PIPELINES*, consider using setting methods like *replace_in_component_priority_dict()*, *set_in_component_priority_dict()* and *setdefault_in_component_priority_dict()* to avoid mistakes.

Check dependencies:

```
class MyAddon:
    def update_settings(self, settings):
        try:
            import boto
        except ImportError:
            raise NotConfigured("MyAddon requires the boto library")
        ...
```

Access the crawler instance:

```
class MyAddon:
    def __init__(self, crawler) -> None:
        super().__init__()
        self.crawler = crawler

    @classmethod
    def from_crawler(cls, crawler):
        return cls(crawler)

    def update_settings(self, settings): ...
```

Use a fallback component:

```
from scrapy.core.downloader.handlers.http import HTTPDownloadHandler
from scrapy.utils.misc import build_from_crawler

FALLBACK_SETTING = "MY_FALLBACK_DOWNLOAD_HANDLER"
```

(continues on next page)

(continued from previous page)

```
class MyHandler:
    lazy = False

    def __init__(self, settings, crawler):
        dhcls = load_object(settings.get(FALLBACK_SETTING))
        self._fallback_handler = build_from_crawler(dhcls, crawler)

    def download_request(self, request, spider):
        if request.meta.get("my_params"):
            # handle the request
            ...
        else:
            return self._fallback_handler.download_request(request, spider)

class MyAddon:
    def update_settings(self, settings):
        if not settings.get(FALLBACK_SETTING):
            settings.set(
                FALLBACK_SETTING,
                settings.getwithbase("DOWNLOAD_HANDLERS")["https"],
                "addon",
            )
        settings["DOWNLOAD_HANDLERS"]["https"] = MyHandler
```

6.3 Downloader Middleware

The downloader middleware is a framework of hooks into Scrapy's request/response processing. It's a light, low-level system for globally altering Scrapy's requests and responses.

6.3.1 Activating a downloader middleware

To activate a downloader middleware component, add it to the *DOWNLOADER_MIDDLEWARES* setting, which is a dict whose keys are the middleware class paths and their values are the middleware orders.

Here's an example:

```
DOWNLOADER_MIDDLEWARES = {
    "myproject.middlewares.CustomDownloaderMiddleware": 543,
}
```

The *DOWNLOADER_MIDDLEWARES* setting is merged with the *DOWNLOADER_MIDDLEWARES_BASE* setting defined in Scrapy (and not meant to be overridden) and then sorted by order to get the final sorted list of enabled middlewares: the first middleware is the one closer to the engine and the last is the one closer to the downloader. In other words, the *process_request()* method of each middleware will be invoked in increasing middleware order (100, 200, 300, ...) and the *process_response()* method of each middleware will be invoked in decreasing order.

To decide which order to assign to your middleware see the *DOWNLOADER_MIDDLEWARES_BASE* setting and pick a value according to where you want to insert the middleware. The order does matter because each middleware performs a different action and your middleware could depend on some previous (or subsequent) middleware being applied.

If you want to disable a built-in middleware (the ones defined in *DOWNLOADER_MIDDLEWARES_BASE* and enabled by default) you must define it in your project's *DOWNLOADER_MIDDLEWARES* setting and assign `None` as its value. For example, if you want to disable the user-agent middleware:

```
DOWNLOADER_MIDDLEWARES = {
    "myproject.middlewares.CustomDownloaderMiddleware": 543,
    "scrapy.downloadermiddlewares.useragent.UserAgentMiddleware": None,
}
```

Finally, keep in mind that some middlewares may need to be enabled through a particular setting. See each middleware documentation for more info.

6.3.2 Writing your own downloader middleware

Each downloader middleware is a *component* that defines one or more of these methods:

class scrapy.downloadermiddlewares.**DownloaderMiddleware**

> **Note**
>
> Any of the downloader middleware methods may also return a deferred.

process_request(*request*, *spider*)

This method is called for each request that goes through the download middleware.

process_request() should either: return None, return a *Response* object, return a *Request* object, or raise *IgnoreRequest*.

If it returns None, Scrapy will continue processing this request, executing all other middlewares until, finally, the appropriate downloader handler is called the request performed (and its response downloaded).

If it returns a *Response* object, Scrapy won't bother calling *any* other *process_request()* or *process_exception()* methods, or the appropriate download function; it'll return that response. The *process_response()* methods of installed middleware is always called on every response.

If it returns a *Request* object, Scrapy will stop calling *process_request()* methods and reschedule the returned request. Once the newly returned request is performed, the appropriate middleware chain will be called on the downloaded response.

If it raises an *IgnoreRequest* exception, the *process_exception()* methods of installed downloader middleware will be called. If none of them handle the exception, the errback function of the request (Request.errback) is called. If no code handles the raised exception, it is ignored and not logged (unlike other exceptions).

Parameters

- **request** (*Request* object) – the request being processed
- **spider** (*Spider* object) – the spider for which this request is intended

process_response(*request*, *response*, *spider*)

process_response() should either: return a *Response* object, return a *Request* object or raise a *IgnoreRequest* exception.

If it returns a *Response* (it could be the same given response, or a brand-new one), that response will continue to be processed with the *process_response()* of the next middleware in the chain.

If it returns a *Request* object, the middleware chain is halted and the returned request is rescheduled to be downloaded in the future. This is the same behavior as if a request is returned from *process_request()*.

If it raises an *IgnoreRequest* exception, the errback function of the request (Request.errback) is called. If no code handles the raised exception, it is ignored and not logged (unlike other exceptions).

Parameters

- **request** (is a *Request* object) – the request that originated the response
- **response** (*Response* object) – the response being processed
- **spider** (*Spider* object) – the spider for which this response is intended

process_exception(*request*, *exception*, *spider*)

Scrapy calls *process_exception()* when a download handler or a *process_request()* (from a downloader middleware) raises an exception (including an *IgnoreRequest* exception)

process_exception() should return: either None, a *Response* object, or a *Request* object.

If it returns None, Scrapy will continue processing this exception, executing any other *process_exception()* methods of installed middleware, until no middleware is left and the default exception handling kicks in.

If it returns a *Response* object, the *process_response()* method chain of installed middleware is started, and Scrapy won't bother calling any other *process_exception()* methods of middleware.

If it returns a *Request* object, the returned request is rescheduled to be downloaded in the future. This stops the execution of *process_exception()* methods of the middleware the same as returning a response would.

Parameters

- **request** (is a *Request* object) – the request that generated the exception
- **exception** (an Exception object) – the raised exception
- **spider** (*Spider* object) – the spider for which this request is intended

6.3.3 Built-in downloader middleware reference

This page describes all downloader middleware components that come with Scrapy. For information on how to use them and how to write your own downloader middleware, see the *downloader middleware usage guide*.

For a list of the components enabled by default (and their orders) see the *DOWNLOADER_MIDDLEWARES_BASE* setting.

CookiesMiddleware

class scrapy.downloadermiddlewares.cookies.**CookiesMiddleware**

This middleware enables working with sites that require cookies, such as those that use sessions. It keeps track of cookies sent by web servers, and sends them back on subsequent requests (from that spider), just like web browsers do.

Caution

When non-UTF8 encoded byte sequences are passed to a *Request*, the CookiesMiddleware will log a warning. Refer to *Advanced customization* to customize the logging behaviour.

Caution

Cookies set via the Cookie header are not considered by the *CookiesMiddleware*. If you need to set cookies for a request, use the *Request.cookies* parameter. This is a known current limitation that is being worked on.

The following settings can be used to configure the cookie middleware:

- *COOKIES_ENABLED*
- *COOKIES_DEBUG*

Multiple cookie sessions per spider

There is support for keeping multiple cookie sessions per spider by using the *cookiejar* Request meta key. By default it uses a single cookie jar (session), but you can pass an identifier to use different ones.

For example:

```
for i, url in enumerate(urls):
    yield scrapy.Request(url, meta={"cookiejar": i}, callback=self.parse_page)
```

Keep in mind that the *cookiejar* meta key is not "sticky". You need to keep passing it along on subsequent requests. For example:

```
def parse_page(self, response):
    # do some processing
    return scrapy.Request(
        "http://www.example.com/otherpage",
        meta={"cookiejar": response.meta["cookiejar"]},
        callback=self.parse_other_page,
    )
```

COOKIES_ENABLED

Default: `True`

Whether to enable the cookies middleware. If disabled, no cookies will be sent to web servers.

Notice that despite the value of *COOKIES_ENABLED* setting if `Request.meta['dont_merge_cookies']` evaluates to `True` the request cookies will **not** be sent to the web server and received cookies in *Response* will **not** be merged with the existing cookies.

For more detailed information see the `cookies` parameter in *Request*.

COOKIES_DEBUG

Default: `False`

If enabled, Scrapy will log all cookies sent in requests (i.e. `Cookie` header) and all cookies received in responses (i.e. `Set-Cookie` header).

Here's an example of a log with *COOKIES_DEBUG* enabled:

```
2011-04-06 14:35:10-0300 [scrapy.core.engine] INFO: Spider opened
2011-04-06 14:35:10-0300 [scrapy.downloadermiddlewares.cookies] DEBUG: Sending cookies␣
↪to: <GET http://www.diningcity.com/netherlands/index.html>
        Cookie: clientlanguage_nl=en_EN
2011-04-06 14:35:14-0300 [scrapy.downloadermiddlewares.cookies] DEBUG: Received cookies␣
↪from: <200 http://www.diningcity.com/netherlands/index.html>
        Set-Cookie: JSESSIONID=B~FA4DC0C496C8762AE4F1A620EAB34F38; Path=/
        Set-Cookie: ip_isocode=US
        Set-Cookie: clientlanguage_nl=en_EN; Expires=Thu, 07-Apr-2011 21:21:34 GMT;␣
```

(continues on next page)

(continued from previous page)

```
↪Path=/
2011-04-06 14:49:50-0300 [scrapy.core.engine] DEBUG: Crawled (200) <GET http://www.
↪diningcity.com/netherlands/index.html> (referer: None)
[...]
```

DefaultHeadersMiddleware

class scrapy.downloadermiddlewares.defaultheaders.**DefaultHeadersMiddleware**

This middleware sets all default requests headers specified in the *DEFAULT_REQUEST_HEADERS* setting.

DownloadTimeoutMiddleware

class scrapy.downloadermiddlewares.downloadtimeout.**DownloadTimeoutMiddleware**

This middleware sets the download timeout for requests specified in the *DOWNLOAD_TIMEOUT* setting or `download_timeout` spider attribute.

> **Note**
>
> You can also set download timeout per-request using *download_timeout* Request.meta key; this is supported even when DownloadTimeoutMiddleware is disabled.

HttpAuthMiddleware

class scrapy.downloadermiddlewares.httpauth.**HttpAuthMiddleware**

This middleware authenticates all requests generated from certain spiders using Basic access authentication (aka. HTTP auth).

To enable HTTP authentication for a spider, set the `http_user` and `http_pass` spider attributes to the authentication data and the `http_auth_domain` spider attribute to the domain which requires this authentication (its subdomains will be also handled in the same way). You can set `http_auth_domain` to `None` to enable the authentication for all requests but you risk leaking your authentication credentials to unrelated domains.

> **Warning**
>
> In previous Scrapy versions HttpAuthMiddleware sent the authentication data with all requests, which is a security problem if the spider makes requests to several different domains. Currently if the `http_auth_domain` attribute is not set, the middleware will use the domain of the first request, which will work for some spiders but not for others. In the future the middleware will produce an error instead.

Example:

```
from scrapy.spiders import CrawlSpider

class SomeIntranetSiteSpider(CrawlSpider):
    http_user = "someuser"
    http_pass = "somepass"
    http_auth_domain = "intranet.example.com"
    name = "intranet.example.com"

    # .. rest of the spider code omitted ...
```

HttpCacheMiddleware

class scrapy.downloadermiddlewares.httpcache.**HttpCacheMiddleware**

This middleware provides low-level cache to all HTTP requests and responses. It has to be combined with a cache storage backend as well as a cache policy.

Scrapy ships with the following HTTP cache storage backends:

- *Filesystem storage backend (default)*
- *DBM storage backend*

You can change the HTTP cache storage backend with the *HTTPCACHE_STORAGE* setting. Or you can also *implement your own storage backend.*

Scrapy ships with two HTTP cache policies:

- *RFC2616 policy*
- *Dummy policy (default)*

You can change the HTTP cache policy with the *HTTPCACHE_POLICY* setting. Or you can also implement your own policy. You can also avoid caching a response on every policy using *dont_cache* meta key equals `True`.

Dummy policy (default)

class scrapy.extensions.httpcache.**DummyPolicy**

This policy has no awareness of any HTTP Cache-Control directives. Every request and its corresponding response are cached. When the same request is seen again, the response is returned without transferring anything from the Internet.

The Dummy policy is useful for testing spiders faster (without having to wait for downloads every time) and for trying your spider offline, when an Internet connection is not available. The goal is to be able to "replay" a spider run *exactly as it ran before*.

RFC2616 policy

class scrapy.extensions.httpcache.**RFC2616Policy**

This policy provides a RFC2616 compliant HTTP cache, i.e. with HTTP Cache-Control awareness, aimed at production and used in continuous runs to avoid downloading unmodified data (to save bandwidth and speed up crawls).

What is implemented:

- Do not attempt to store responses/requests with `no-store` cache-control directive set
- Do not serve responses from cache if `no-cache` cache-control directive is set even for fresh responses
- Compute freshness lifetime from `max-age` cache-control directive
- Compute freshness lifetime from `Expires` response header
- Compute freshness lifetime from `Last-Modified` response header (heuristic used by Firefox)
- Compute current age from `Age` response header
- Compute current age from `Date` header
- Revalidate stale responses based on `Last-Modified` response header
- Revalidate stale responses based on `ETag` response header
- Set `Date` header for any received response missing it

- Support `max-stale` cache-control directive in requests

This allows spiders to be configured with the full RFC2616 cache policy, but avoid revalidation on a request-by-request basis, while remaining conformant with the HTTP spec.

Example:

Add `Cache-Control: max-stale=600` to Request headers to accept responses that have exceeded their expiration time by no more than 600 seconds.

See also: RFC2616, 14.9.3

What is missing:

- `Pragma: no-cache` support https://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.9.1
- `Vary` header support https://www.w3.org/Protocols/rfc2616/rfc2616-sec13.html#sec13.6
- Invalidation after updates or deletes https://www.w3.org/Protocols/rfc2616/rfc2616-sec13.html#sec13.10
- ... probably others ..

Filesystem storage backend (default)

class scrapy.extensions.httpcache.**FilesystemCacheStorage**

File system storage backend is available for the HTTP cache middleware.

Each request/response pair is stored in a different directory containing the following files:

- `request_body` - the plain request body
- `request_headers` - the request headers (in raw HTTP format)
- `response_body` - the plain response body
- `response_headers` - the request headers (in raw HTTP format)
- `meta` - some metadata of this cache resource in Python `repr()` format (grep-friendly format)
- `pickled_meta` - the same metadata in `meta` but pickled for more efficient deserialization

The directory name is made from the request fingerprint (see `scrapy.utils.request.fingerprint`), and one level of subdirectories is used to avoid creating too many files into the same directory (which is inefficient in many file systems). An example directory could be:

```
/path/to/cache/dir/example.com/72/72811f648e718090f041317756c03adb0ada46c7
```

DBM storage backend

class scrapy.extensions.httpcache.**DbmCacheStorage**

A DBM storage backend is also available for the HTTP cache middleware.

By default, it uses the dbm, but you can change it with the *HTTPCACHE_DBM_MODULE* setting.

Writing your own storage backend

You can implement a cache storage backend by creating a Python class that defines the methods described below.

class scrapy.extensions.httpcache.**CacheStorage**

open_spider(*spider*)

This method gets called after a spider has been opened for crawling. It handles the *open_spider* signal.

Parameters
spider (*Spider* object) – the spider which has been opened

close_spider(*spider*)

This method gets called after a spider has been closed. It handles the *close_spider* signal.

Parameters
spider (*Spider* object) – the spider which has been closed

retrieve_response(*spider*, *request*)

Return response if present in cache, or `None` otherwise.

Parameters

- **spider** (*Spider* object) – the spider which generated the request
- **request** (*Request* object) – the request to find cached response for

store_response(*spider*, *request*, *response*)

Store the given response in the cache.

Parameters

- **spider** (*Spider* object) – the spider for which the response is intended
- **request** (*Request* object) – the corresponding request the spider generated
- **response** (*Response* object) – the response to store in the cache

In order to use your storage backend, set:

- *HTTPCACHE_STORAGE* to the Python import path of your custom storage class.

HTTPCache middleware settings

The `HttpCacheMiddleware` can be configured through the following settings:

HTTPCACHE_ENABLED

Default: `False`

Whether the HTTP cache will be enabled.

HTTPCACHE_EXPIRATION_SECS

Default: `0`

Expiration time for cached requests, in seconds.

Cached requests older than this time will be re-downloaded. If zero, cached requests will never expire.

HTTPCACHE_DIR

Default: `'httpcache'`

The directory to use for storing the (low-level) HTTP cache. If empty, the HTTP cache will be disabled. If a relative path is given, is taken relative to the project data dir. For more info see: *Default structure of Scrapy projects*.

HTTPCACHE_IGNORE_HTTP_CODES

Default: `[]`

Don't cache response with these HTTP codes.

HTTPCACHE_IGNORE_MISSING

Default: `False`

If enabled, requests not found in the cache will be ignored instead of downloaded.

HTTPCACHE_IGNORE_SCHEMES

Default: `['file']`

Don't cache responses with these URI schemes.

HTTPCACHE_STORAGE

Default: `'scrapy.extensions.httpcache.FilesystemCacheStorage'`

The class which implements the cache storage backend.

HTTPCACHE_DBM_MODULE

Default: `'dbm'`

The database module to use in the *DBM storage backend*. This setting is specific to the DBM backend.

HTTPCACHE_POLICY

Default: `'scrapy.extensions.httpcache.DummyPolicy'`

The class which implements the cache policy.

HTTPCACHE_GZIP

Default: `False`

If enabled, will compress all cached data with gzip. This setting is specific to the Filesystem backend.

HTTPCACHE_ALWAYS_STORE

Default: `False`

If enabled, will cache pages unconditionally.

A spider may wish to have all responses available in the cache, for future use with `Cache-Control: max-stale`, for instance. The DummyPolicy caches all responses but never revalidates them, and sometimes a more nuanced policy is desirable.

This setting still respects `Cache-Control: no-store` directives in responses. If you don't want that, filter `no-store` out of the Cache-Control headers in responses you feed to the cache middleware.

HTTPCACHE_IGNORE_RESPONSE_CACHE_CONTROLS

Default: `[]`

List of Cache-Control directives in responses to be ignored.

Sites often set "no-store", "no-cache", "must-revalidate", etc., but get upset at the traffic a spider can generate if it actually respects those directives. This allows to selectively ignore Cache-Control directives that are known to be unimportant for the sites being crawled.

We assume that the spider will not issue Cache-Control directives in requests unless it actually needs them, so directives in requests are not filtered.

HttpCompressionMiddleware

class scrapy.downloadermiddlewares.httpcompression.**HttpCompressionMiddleware**

This middleware allows compressed (gzip, deflate) traffic to be sent/received from web sites.

This middleware also supports decoding brotli-compressed as well as zstd-compressed responses, provided that brotli or zstandard is installed, respectively.

HttpCompressionMiddleware Settings

COMPRESSION_ENABLED

Default: `True`

Whether the Compression middleware will be enabled.

HttpProxyMiddleware

class scrapy.downloadermiddlewares.httpproxy.**HttpProxyMiddleware**

This middleware sets the HTTP proxy to use for requests, by setting the `proxy` meta value for *`Request`* objects.

Like the Python standard library module `urllib.request`, it obeys the following environment variables:

- `http_proxy`
- `https_proxy`
- `no_proxy`

You can also set the meta key `proxy` per-request, to a value like `http://some_proxy_server:port` or `http://username:password@some_proxy_server:port`. Keep in mind this value will take precedence over `http_proxy`/`https_proxy` environment variables, and it will also ignore `no_proxy` environment variable.

HttpProxyMiddleware settings

HTTPPROXY_ENABLED

Default: `True`

Whether or not to enable the *`HttpProxyMiddleware`*.

HTTPPROXY_AUTH_ENCODING

Default: `"latin-1"`

The default encoding for proxy authentication on *`HttpProxyMiddleware`*.

OffsiteMiddleware

class scrapy.downloadermiddlewares.offsite.**OffsiteMiddleware**

Added in version 2.11.2.

Filters out Requests for URLs outside the domains covered by the spider.

This middleware filters out every request whose host names aren't in the spider's *allowed_domains* attribute. All subdomains of any domain in the list are also allowed. E.g. the rule `www.example.org` will also allow `bob.www.example.org` but not `www2.example.com` nor `example.com`.

When your spider returns a request for a domain not belonging to those covered by the spider, this middleware will log a debug message similar to this one:

```
DEBUG: Filtered offsite request to 'offsite.example': <GET http://offsite.example/
↪some/page.html>
```

To avoid filling the log with too much noise, it will only print one of these messages for each new domain filtered. So, for example, if another request for `offsite.example` is filtered, no log message will be printed. But if a request for `other.example` is filtered, a message will be printed (but only for the first request filtered).

If the spider doesn't define an *allowed_domains* attribute, or the attribute is empty, the offsite middleware will allow all requests. If the request has the *dont_filter* attribute set to `True` or `Request.meta` has `allow_offsite` set to `True`, then the OffsiteMiddleware will allow the request even if its domain is not listed in allowed domains.

RedirectMiddleware

class scrapy.downloadermiddlewares.redirect.**RedirectMiddleware**

This middleware handles redirection of requests based on response status.

The urls which the request goes through (while being redirected) can be found in the `redirect_urls` *Request.meta* key. The reason behind each redirect in *redirect_urls* can be found in the `redirect_reasons` *Request.meta* key. For example: `[301, 302, 307, 'meta refresh']`.

The format of a reason depends on the middleware that handled the corresponding redirect. For example, *RedirectMiddleware* indicates the triggering response status code as an integer, while *MetaRefreshMiddleware* always uses the `'meta refresh'` string as reason.

The *RedirectMiddleware* can be configured through the following settings (see the settings documentation for more info):

- *REDIRECT_ENABLED*
- *REDIRECT_MAX_TIMES*

If *Request.meta* has `dont_redirect` key set to True, the request will be ignored by this middleware.

If you want to handle some redirect status codes in your spider, you can specify these in the `handle_httpstatus_list` spider attribute.

For example, if you want the redirect middleware to ignore 301 and 302 responses (and pass them through to your spider) you can do this:

```
class MySpider(CrawlSpider):
    handle_httpstatus_list = [301, 302]
```

The `handle_httpstatus_list` key of *Request.meta* can also be used to specify which response codes to allow on a per-request basis. You can also set the meta key `handle_httpstatus_all` to `True` if you want to allow any response code for a request.

RedirectMiddleware settings

REDIRECT_ENABLED

Default: `True`

Whether the Redirect middleware will be enabled.

REDIRECT_MAX_TIMES

Default: `20`

The maximum number of redirections that will be followed for a single request. If maximum redirections are exceeded, the request is aborted and ignored.

MetaRefreshMiddleware

class scrapy.downloadermiddlewares.redirect.**MetaRefreshMiddleware**

This middleware handles redirection of requests based on meta-refresh html tag.

The *MetaRefreshMiddleware* can be configured through the following settings (see the settings documentation for more info):

- *METAREFRESH_ENABLED*
- *METAREFRESH_IGNORE_TAGS*
- *METAREFRESH_MAXDELAY*

This middleware obey *REDIRECT_MAX_TIMES* setting, *dont_redirect*, *redirect_urls* and *redirect_reasons* request meta keys as described for *RedirectMiddleware*

MetaRefreshMiddleware settings

METAREFRESH_ENABLED

Default: `True`

Whether the Meta Refresh middleware will be enabled.

METAREFRESH_IGNORE_TAGS

Default: `[]`

Meta tags within these tags are ignored.

Changed in version 2.0: The default value of *METAREFRESH_IGNORE_TAGS* changed from `["script", "noscript"]` to `[]`.

Changed in version 2.11.2: The default value of *METAREFRESH_IGNORE_TAGS* changed from `[]` to `["noscript"]`.

METAREFRESH_MAXDELAY

Default: `100`

The maximum meta-refresh delay (in seconds) to follow the redirection. Some sites use meta-refresh for redirecting to a session expired page, so we restrict automatic redirection to the maximum delay.

RetryMiddleware

class scrapy.downloadermiddlewares.retry.**RetryMiddleware**

A middleware to retry failed requests that are potentially caused by temporary problems such as a connection timeout or HTTP 500 error.

Failed pages are collected on the scraping process and rescheduled at the end, once the spider has finished crawling all regular (non failed) pages.

The *RetryMiddleware* can be configured through the following settings (see the settings documentation for more info):

- *RETRY_ENABLED*
- *RETRY_TIMES*
- *RETRY_HTTP_CODES*
- *RETRY_EXCEPTIONS*

If *Request.meta* has `dont_retry` key set to True, the request will be ignored by this middleware.

To retry requests from a spider callback, you can use the *get_retry_request()* function:

scrapy.downloadermiddlewares.retry.**get_retry_request**(*request: Request*, ***, *spider: Spider*, *reason: str | Exception | type[Exception] = 'unspecified'*, *max_retry_times: int | None = None*, *priority_adjust: int | None = None*, *logger: Logger = <Logger scrapy.downloadermiddlewares.retry (WARNING)>*, *stats_base_key: str = 'retry'*) → *Request* | None

Returns a new *Request* object to retry the specified request, or `None` if retries of the specified request have been exhausted.

For example, in a *Spider* callback, you could use it as follows:

```
def parse(self, response):
    if not response.text:
        new_request_or_none = get_retry_request(
            response.request,
            spider=self,
            reason='empty',
        )
        return new_request_or_none
```

spider is the *Spider* instance which is asking for the retry request. It is used to access the *settings* and *stats*, and to provide extra logging context (see `logging.debug()`).

reason is a string or an `Exception` object that indicates the reason why the request needs to be retried. It is used to name retry stats.

max_retry_times is a number that determines the maximum number of times that *request* can be retried. If not specified or `None`, the number is read from the *max_retry_times* meta key of the request. If the *max_retry_times* meta key is not defined or `None`, the number is read from the *RETRY_TIMES* setting.

priority_adjust is a number that determines how the priority of the new request changes in relation to *request*. If not specified, the number is read from the *RETRY_PRIORITY_ADJUST* setting.

logger is the logging.Logger object to be used when logging messages

stats_base_key is a string to be used as the base key for the retry-related job stats

RetryMiddleware Settings

RETRY_ENABLED

Default: `True`

Whether the Retry middleware will be enabled.

RETRY_TIMES

Default: `2`

Maximum number of times to retry, in addition to the first download.

Maximum number of retries can also be specified per-request using *max_retry_times* attribute of *Request.meta*. When initialized, the *max_retry_times* meta key takes higher precedence over the *RETRY_TIMES* setting.

RETRY_HTTP_CODES

Default: `[500, 502, 503, 504, 522, 524, 408, 429]`

Which HTTP response codes to retry. Other errors (DNS lookup issues, connections lost, etc) are always retried.

In some cases you may want to add 400 to *RETRY_HTTP_CODES* because it is a common code used to indicate server overload. It is not included by default because HTTP specs say so.

RETRY_EXCEPTIONS

Default:

```
[
    'twisted.internet.defer.TimeoutError',
    'twisted.internet.error.TimeoutError',
    'twisted.internet.error.DNSLookupError',
    'twisted.internet.error.ConnectionRefusedError',
    'twisted.internet.error.ConnectionDone',
    'twisted.internet.error.ConnectError',
    'twisted.internet.error.ConnectionLost',
    'twisted.internet.error.TCPTimedOutError',
    'twisted.web.client.ResponseFailed',
    IOError,
    'scrapy.core.downloader.handlers.http11.TunnelError',
]
```

List of exceptions to retry.

Each list entry may be an exception type or its import path as a string.

An exception will not be caught when the exception type is not in *RETRY_EXCEPTIONS* or when the maximum number of retries for a request has been exceeded (see *RETRY_TIMES*). To learn about uncaught exception propagation, see *process_exception()*.

RETRY_PRIORITY_ADJUST

Default: `-1`

Adjust retry request priority relative to original request:

- a positive priority adjust means higher priority.

- **a negative priority adjust (default) means lower priority.**

RobotsTxtMiddleware

class scrapy.downloadermiddlewares.robotstxt.**RobotsTxtMiddleware**

This middleware filters out requests forbidden by the robots.txt exclusion standard.

To make sure Scrapy respects robots.txt make sure the middleware is enabled and the *ROBOTSTXT_OBEY* setting is enabled.

The *ROBOTSTXT_USER_AGENT* setting can be used to specify the user agent string to use for matching in the robots.txt file. If it is `None`, the User-Agent header you are sending with the request or the *USER_AGENT* setting (in that order) will be used for determining the user agent to use in the robots.txt file.

This middleware has to be combined with a robots.txt parser.

Scrapy ships with support for the following robots.txt parsers:

- *Protego* (default)
- *RobotFileParser*
- *Robotexclusionrulesparser*

You can change the robots.txt parser with the *ROBOTSTXT_PARSER* setting. Or you can also *implement support for a new parser*.

If *Request.meta* has `dont_obey_robotstxt` key set to True the request will be ignored by this middleware even if *ROBOTSTXT_OBEY* is enabled.

Parsers vary in several aspects:

- Language of implementation
- Supported specification
- Support for wildcard matching
- Usage of length based rule: in particular for `Allow` and `Disallow` directives, where the most specific rule based on the length of the path trumps the less specific (shorter) rule

Performance comparison of different parsers is available at the following link.

Protego parser

Based on Protego:

- implemented in Python
- is compliant with Google's Robots.txt Specification
- supports wildcard matching
- uses the length based rule

Scrapy uses this parser by default.

RobotFileParser

Based on `RobotFileParser`:

- is Python's built-in robots.txt parser
- is compliant with Martijn Koster's 1996 draft specification
- lacks support for wildcard matching

- doesn't use the length based rule

It is faster than Protego and backward-compatible with versions of Scrapy before 1.8.0.

In order to use this parser, set:

- *ROBOTSTXT_PARSER* to `scrapy.robotstxt.PythonRobotParser`

Robotexclusionrulesparser

Based on Robotexclusionrulesparser:

- implemented in Python
- is compliant with Martijn Koster's 1996 draft specification
- supports wildcard matching
- doesn't use the length based rule

In order to use this parser:

- Install `Robotexclusionrulesparser` by running `pip install robotexclusionrulesparser`
- Set *ROBOTSTXT_PARSER* setting to `scrapy.robotstxt.RerpRobotParser`

Implementing support for a new parser

You can implement support for a new robots.txt parser by subclassing the abstract base class *RobotParser* and implementing the methods described below.

class scrapy.robotstxt.**RobotParser**

abstract allowed(*url: str | bytes*, *user_agent: str | bytes*) → bool

Return `True` if `user_agent` is allowed to crawl `url`, otherwise return `False`.

Parameters

- **url** (*str or bytes*) – Absolute URL
- **user_agent** (*str or bytes*) – User agent

abstract classmethod from_crawler(*crawler: Crawler*, *robotstxt_body: bytes*) → Self

Parse the content of a robots.txt file as bytes. This must be a class method. It must return a new instance of the parser backend.

Parameters

- **crawler** (*Crawler* instance) – crawler which made the request
- **robotstxt_body** (*bytes*) – content of a robots.txt file.

DownloaderStats

class scrapy.downloadermiddlewares.stats.**DownloaderStats**

Middleware that stores stats of all requests, responses and exceptions that pass through it.

To use this middleware you must enable the *DOWNLOADER_STATS* setting.

UserAgentMiddleware

class scrapy.downloadermiddlewares.useragent.**UserAgentMiddleware**

Middleware that allows spiders to override the default user agent.

In order for a spider to override the default user agent, its `user_agent` attribute must be set.

6.4 Spider Middleware

The spider middleware is a framework of hooks into Scrapy's spider processing mechanism where you can plug custom functionality to process the responses that are sent to *Spiders* for processing and to process the requests and items that are generated from spiders.

6.4.1 Activating a spider middleware

To activate a spider middleware component, add it to the *SPIDER_MIDDLEWARES* setting, which is a dict whose keys are the middleware class path and their values are the middleware orders.

Here's an example:

```
SPIDER_MIDDLEWARES = {
    "myproject.middlewares.CustomSpiderMiddleware": 543,
}
```

The *SPIDER_MIDDLEWARES* setting is merged with the *SPIDER_MIDDLEWARES_BASE* setting defined in Scrapy (and not meant to be overridden) and then sorted by order to get the final sorted list of enabled middlewares: the first middleware is the one closer to the engine and the last is the one closer to the spider. In other words, the *process_spider_input()* method of each middleware will be invoked in increasing middleware order (100, 200, 300, ...), and the *process_spider_output()* method of each middleware will be invoked in decreasing order.

To decide which order to assign to your middleware see the *SPIDER_MIDDLEWARES_BASE* setting and pick a value according to where you want to insert the middleware. The order does matter because each middleware performs a different action and your middleware could depend on some previous (or subsequent) middleware being applied.

If you want to disable a builtin middleware (the ones defined in *SPIDER_MIDDLEWARES_BASE*, and enabled by default) you must define it in your project *SPIDER_MIDDLEWARES* setting and assign `None` as its value. For example, if you want to disable the off-site middleware:

```
SPIDER_MIDDLEWARES = {
    "scrapy.spidermiddlewares.referer.RefererMiddleware": None,
    "myproject.middlewares.CustomRefererSpiderMiddleware": 700,
}
```

Finally, keep in mind that some middlewares may need to be enabled through a particular setting. See each middleware documentation for more info.

6.4.2 Writing your own spider middleware

Each spider middleware is a *component* that defines one or more of these methods:

class scrapy.spidermiddlewares.**SpiderMiddleware**

async process_start(*start: AsyncIterator[Any]*, */*) → AsyncIterator[Any]

Iterate over the output of *start()* or that of the *process_start()* method of an earlier spider middleware, overriding it. For example:

```
async def process_start(self, start):
    async for item_or_request in start:
        yield item_or_request
```

You may yield the same type of objects as *start()*.

To write spider middlewares that work on Scrapy versions lower than 2.13, define also a synchronous `process_start_requests()` method that returns an iterable. For example:

```
def process_start_requests(self, start, spider):
    yield from start
```

process_spider_input(*response*, *spider*)

This method is called for each response that goes through the spider middleware and into the spider, for processing.

process_spider_input() should return `None` or raise an exception.

If it returns `None`, Scrapy will continue processing this response, executing all other middlewares until, finally, the response is handed to the spider for processing.

If it raises an exception, Scrapy won't bother calling any other spider middleware *process_spider_input()* and will call the request errback if there is one, otherwise it will start the *process_spider_exception()* chain. The output of the errback is chained back in the other direction for *process_spider_output()* to process it, or *process_spider_exception()* if it raised an exception.

Parameters

- **response** (*Response* object) – the response being processed
- **spider** (*Spider* object) – the spider for which this response is intended

process_spider_output(*response*, *result*, *spider*)

This method is called with the results returned from the Spider, after it has processed the response.

process_spider_output() must return an iterable of *Request* objects and *item objects*.

Changed in version 2.7: This method may be defined as an asynchronous generator, in which case `result` is an asynchronous iterable.

Consider defining this method as an asynchronous generator, which will be a requirement in a future version of Scrapy. However, if you plan on sharing your spider middleware with other people, consider either *enforcing Scrapy 2.7* as a minimum requirement of your spider middleware, or *making your spider middleware universal* so that it works with Scrapy versions earlier than Scrapy 2.7.

Parameters

- **response** (*Response* object) – the response which generated this output from the spider
- **result** (an iterable of *Request* objects and *item objects*) – the result returned by the spider
- **spider** (*Spider* object) – the spider whose result is being processed

async process_spider_output_async(*response*, *result*, *spider*)

Added in version 2.7.

If defined, this method must be an asynchronous generator, which will be called instead of *process_spider_output()* if `result` is an asynchronous iterable.

process_spider_exception(*response*, *exception*, *spider*)

This method is called when a spider or *process_spider_output()* method (from a previous spider middleware) raises an exception.

process_spider_exception() should return either None or an iterable of *Request* or *item* objects.

If it returns None, Scrapy will continue processing this exception, executing any other *process_spider_exception()* in the following middleware components, until no middleware components are left and the exception reaches the engine (where it's logged and discarded).

If it returns an iterable the *process_spider_output()* pipeline kicks in, starting from the next spider middleware, and no other *process_spider_exception()* will be called.

Parameters

- **response** (*Response* object) – the response being processed when the exception was raised
- **exception** (Exception object) – the exception raised
- **spider** (*Spider* object) – the spider which raised the exception

Base class for custom spider middlewares

Scrapy provides a base class for custom spider middlewares. It's not required to use it but it can help with simplifying middleware implementations and reducing the amount of boilerplate code in *universal middlewares*.

class scrapy.spidermiddlewares.base.**BaseSpiderMiddleware**(*crawler:* Crawler)

Optional base class for spider middlewares.

Added in version 2.13.

This class provides helper methods for asynchronous process_spider_output() and process_start() methods. Middlewares that don't have either of these methods don't need to use this class.

You can override the *get_processed_request()* method to add processing code for requests and the *get_processed_item()* method to add processing code for items. These methods take a single request or item from the spider output iterable and return a request or item (the same or a new one), or None to remove this request or item from the processing.

get_processed_item(*item: Any*, *response:* Response | *None*) → Any

Return a processed item from the spider output.

This method is called with a single item from the start seeds or the spider output. It should return the same or a different item, or None to ignore it.

Parameters

- **item** (*item object*) – the input item
- **response** (*Response* object or None for start seeds) – the response being processed

Returns

the processed item or None

get_processed_request(*request:* Request, *response:* Response | *None*) → *Request* | None

Return a processed request from the spider output.

This method is called with a single request from the start seeds or the spider output. It should return the same or a different request, or None to ignore it.

Parameters

- **request** (*Request* object) – the input request

- **response** (*Response* object or None for start seeds) – the response being processed

Returns
the processed request or None

6.4.3 Built-in spider middleware reference

This page describes all spider middleware components that come with Scrapy. For information on how to use them and how to write your own spider middleware, see the *spider middleware usage guide*.

For a list of the components enabled by default (and their orders) see the *SPIDER_MIDDLEWARES_BASE* setting.

DepthMiddleware

class scrapy.spidermiddlewares.depth.**DepthMiddleware**

DepthMiddleware is used for tracking the depth of each Request inside the site being scraped. It works by setting `request.meta['depth'] = 0` whenever there is no value previously set (usually just the first Request) and incrementing it by 1 otherwise.

It can be used to limit the maximum depth to scrape, control Request priority based on their depth, and things like that.

The *DepthMiddleware* can be configured through the following settings (see the settings documentation for more info):

- *DEPTH_LIMIT* - The maximum depth that will be allowed to crawl for any site. If zero, no limit will be imposed.
- *DEPTH_STATS_VERBOSE* - Whether to collect the number of requests for each depth.
- *DEPTH_PRIORITY* - Whether to prioritize the requests based on their depth.

HttpErrorMiddleware

class scrapy.spidermiddlewares.httperror.**HttpErrorMiddleware**

Filter out unsuccessful (erroneous) HTTP responses so that spiders don't have to deal with them, which (most of the time) imposes an overhead, consumes more resources, and makes the spider logic more complex.

According to the HTTP standard, successful responses are those whose status codes are in the 200-300 range.

If you still want to process response codes outside that range, you can specify which response codes the spider is able to handle using the `handle_httpstatus_list` spider attribute or *HTTPERROR_ALLOWED_CODES* setting.

For example, if you want your spider to handle 404 responses you can do this:

```
from scrapy.spiders import CrawlSpider

class MySpider(CrawlSpider):
    handle_httpstatus_list = [404]
```

The `handle_httpstatus_list` key of *Request.meta* can also be used to specify which response codes to allow on a per-request basis. You can also set the meta key `handle_httpstatus_all` to `True` if you want to allow any response code for a request, and `False` to disable the effects of the `handle_httpstatus_all` key.

Keep in mind, however, that it's usually a bad idea to handle non-200 responses, unless you really know what you're doing.

For more information see: HTTP Status Code Definitions.

HttpErrorMiddleware settings

HTTPERROR_ALLOWED_CODES

Default: `[]`

Pass all responses with non-200 status codes contained in this list.

HTTPERROR_ALLOW_ALL

Default: `False`

Pass all responses, regardless of its status code.

RefererMiddleware

class scrapy.spidermiddlewares.referer.**RefererMiddleware**

Populates Request `Referer` header, based on the URL of the Response which generated it.

RefererMiddleware settings

REFERER_ENABLED

Default: `True`

Whether to enable referer middleware.

REFERRER_POLICY

Default: `'scrapy.spidermiddlewares.referer.DefaultReferrerPolicy'` Referrer Policy to apply when populating Request "Referer" header.

> **Note**
>
> You can also set the Referrer Policy per request, using the special `"referrer_policy"` *Request.meta* key, with the same acceptable values as for the `REFERRER_POLICY` setting.

Acceptable values for REFERRER_POLICY

- either a path to a `scrapy.spidermiddlewares.referer.ReferrerPolicy` subclass — a custom policy or one of the built-in ones (see classes below),
- or one or more comma-separated standard W3C-defined string values,
- or the special `"scrapy-default"`.

String value	Class name (as a string)
`"scrapy-default"` (default)	*scrapy.spidermiddlewares.referer.DefaultReferrerPolicy*
“no-referrer”	*scrapy.spidermiddlewares.referer.NoReferrerPolicy*
“no-referrer-when-downgrade”	*scrapy.spidermiddlewares.referer.NoReferrerWhenDowngradePolicy*
“same-origin”	*scrapy.spidermiddlewares.referer.SameOriginPolicy*
“origin”	*scrapy.spidermiddlewares.referer.OriginPolicy*
“strict-origin”	*scrapy.spidermiddlewares.referer.StrictOriginPolicy*
“origin-when-cross-origin”	*scrapy.spidermiddlewares.referer.OriginWhenCrossOriginPolicy*
“strict-origin-when-cross-origin”	*scrapy.spidermiddlewares.referer.StrictOriginWhenCrossOriginPolicy*
“unsafe-url”	*scrapy.spidermiddlewares.referer.UnsafeUrlPolicy*

class scrapy.spidermiddlewares.referer.**DefaultReferrerPolicy**

A variant of “no-referrer-when-downgrade”, with the addition that “Referer” is not sent if the parent request was using `file://` or `s3://` scheme.

Warning

Scrapy’s default referrer policy — just like “no-referrer-when-downgrade”, the W3C-recommended value for browsers — will send a non-empty “Referer” header from any `http(s)://` to any `https://` URL, even if the domain is different.

“same-origin” may be a better choice if you want to remove referrer information for cross-domain requests.

class scrapy.spidermiddlewares.referer.**NoReferrerPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-no-referrer

The simplest policy is “no-referrer”, which specifies that no referrer information is to be sent along with requests made from a particular request client to any origin. The header will be omitted entirely.

class scrapy.spidermiddlewares.referer.**NoReferrerWhenDowngradePolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-no-referrer-when-downgrade

The “no-referrer-when-downgrade” policy sends a full URL along with requests from a TLS-protected environment settings object to a potentially trustworthy URL, and requests from clients which are not TLS-protected to any origin.

Requests from TLS-protected clients to non-potentially trustworthy URLs, on the other hand, will contain no referrer information. A Referer HTTP header will not be sent.

This is a user agent’s default behavior, if no policy is otherwise specified.

Note

“no-referrer-when-downgrade” policy is the W3C-recommended default, and is used by major web browsers.

However, it is NOT Scrapy’s default referrer policy (see *DefaultReferrerPolicy*).

class scrapy.spidermiddlewares.referer.**SameOriginPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-same-origin

The "same-origin" policy specifies that a full URL, stripped for use as a referrer, is sent as referrer information when making same-origin requests from a particular request client.

Cross-origin requests, on the other hand, will contain no referrer information. A Referer HTTP header will not be sent.

class scrapy.spidermiddlewares.referer.**OriginPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-origin

The "origin" policy specifies that only the ASCII serialization of the origin of the request client is sent as referrer information when making both same-origin requests and cross-origin requests from a particular request client.

class scrapy.spidermiddlewares.referer.**StrictOriginPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-strict-origin

The "strict-origin" policy sends the ASCII serialization of the origin of the request client when making requests: - from a TLS-protected environment settings object to a potentially trustworthy URL, and - from non-TLS-protected environment settings objects to any origin.

Requests from TLS-protected request clients to non- potentially trustworthy URLs, on the other hand, will contain no referrer information. A Referer HTTP header will not be sent.

class scrapy.spidermiddlewares.referer.**OriginWhenCrossOriginPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-origin-when-cross-origin

The "origin-when-cross-origin" policy specifies that a full URL, stripped for use as a referrer, is sent as referrer information when making same-origin requests from a particular request client, and only the ASCII serialization of the origin of the request client is sent as referrer information when making cross-origin requests from a particular request client.

class scrapy.spidermiddlewares.referer.**StrictOriginWhenCrossOriginPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-strict-origin-when-cross-origin

The "strict-origin-when-cross-origin" policy specifies that a full URL, stripped for use as a referrer, is sent as referrer information when making same-origin requests from a particular request client, and only the ASCII serialization of the origin of the request client when making cross-origin requests:

- from a TLS-protected environment settings object to a potentially trustworthy URL, and
- from non-TLS-protected environment settings objects to any origin.

Requests from TLS-protected clients to non- potentially trustworthy URLs, on the other hand, will contain no referrer information. A Referer HTTP header will not be sent.

class scrapy.spidermiddlewares.referer.**UnsafeUrlPolicy**

https://www.w3.org/TR/referrer-policy/#referrer-policy-unsafe-url

The "unsafe-url" policy specifies that a full URL, stripped for use as a referrer, is sent along with both cross-origin requests and same-origin requests made from a particular request client.

Note: The policy's name doesn't lie; it is unsafe. This policy will leak origins and paths from TLS-protected resources to insecure origins. Carefully consider the impact of setting such a policy for potentially sensitive documents.

Warning

"unsafe-url" policy is NOT recommended.

StartSpiderMiddleware

class scrapy.spidermiddlewares.start.**StartSpiderMiddleware**(*crawler:* Crawler)

Set *is_start_request*.

is_start_request

meta key that is set to `True` in *start requests*, allowing you to tell start requests apart from other requests, e.g. in *downloader middlewares*.

UrlLengthMiddleware

class scrapy.spidermiddlewares.urllength.**UrlLengthMiddleware**

Filters out requests with URLs longer than URLLENGTH_LIMIT

The *UrlLengthMiddleware* can be configured through the following settings (see the settings documentation for more info):

- *URLLENGTH_LIMIT* - The maximum URL length to allow for crawled URLs.

6.5 Extensions

Extensions are *components* that allow inserting your own custom functionality into Scrapy.

Unlike other components, extensions do not have a specific role in Scrapy. They are "wildcard" components that can be used for anything that does not fit the role of any other type of component.

6.5.1 Loading and activating extensions

Extensions are loaded at startup by creating a single instance of the extension class per spider being run.

To enable an extension, add it to the *EXTENSIONS* setting. For example:

```
EXTENSIONS = {
    "scrapy.extensions.corestats.CoreStats": 500,
    "scrapy.extensions.telnet.TelnetConsole": 500,
}
```

EXTENSIONS is merged with *EXTENSIONS_BASE* (not meant to be overridden), and the priorities in the resulting value determine the *loading* order.

As extensions typically do not depend on each other, their loading order is irrelevant in most cases. This is why the *EXTENSIONS_BASE* setting defines all extensions with the same order (`0`). However, you may need to carefully use priorities if you add an extension that depends on other extensions being already loaded.

6.5.2 Writing your own extension

Each extension is a *component*.

Typically, extensions connect to *signals* and perform tasks triggered by them.

Sample extension

Here we will implement a simple extension to illustrate the concepts described in the previous section. This extension will log a message every time:

- a spider is opened

- a spider is closed
- a specific number of items are scraped

The extension will be enabled through the `MYEXT_ENABLED` setting and the number of items will be specified through the `MYEXT_ITEMCOUNT` setting.

Here is the code of such extension:

```
import logging
from scrapy import signals
from scrapy.exceptions import NotConfigured

logger = logging.getLogger(__name__)

class SpiderOpenCloseLogging:
    def __init__(self, item_count):
        self.item_count = item_count
        self.items_scraped = 0

    @classmethod
    def from_crawler(cls, crawler):
        # first check if the extension should be enabled and raise
        # NotConfigured otherwise
        if not crawler.settings.getbool("MYEXT_ENABLED"):
            raise NotConfigured

        # get the number of items from settings
        item_count = crawler.settings.getint("MYEXT_ITEMCOUNT", 1000)

        # instantiate the extension object
        ext = cls(item_count)

        # connect the extension object to signals
        crawler.signals.connect(ext.spider_opened, signal=signals.spider_opened)
        crawler.signals.connect(ext.spider_closed, signal=signals.spider_closed)
        crawler.signals.connect(ext.item_scraped, signal=signals.item_scraped)

        # return the extension object
        return ext

    def spider_opened(self, spider):
        logger.info("opened spider %s", spider.name)

    def spider_closed(self, spider):
        logger.info("closed spider %s", spider.name)

    def item_scraped(self, item, spider):
        self.items_scraped += 1
        if self.items_scraped % self.item_count == 0:
            logger.info("scraped %d items", self.items_scraped)
```

6.5.3 Built-in extensions reference

General purpose extensions

Log Stats extension

class scrapy.extensions.logstats.**LogStats**

Log basic stats like crawled pages and scraped items.

Core Stats extension

class scrapy.extensions.corestats.**CoreStats**

Enable the collection of core statistics, provided the stats collection is enabled (see *Stats Collection*).

Telnet console extension

class scrapy.extensions.telnet.**TelnetConsole**

Provides a telnet console for getting into a Python interpreter inside the currently running Scrapy process, which can be very useful for debugging.

The telnet console must be enabled by the *TELNETCONSOLE_ENABLED* setting, and the server will listen in the port specified in *TELNETCONSOLE_PORT*.

Memory usage extension

class scrapy.extensions.memusage.**MemoryUsage**

> **Note**
>
> This extension does not work in Windows.

Monitors the memory used by the Scrapy process that runs the spider and:

1. sends a notification e-mail when it exceeds a certain value
2. closes the spider when it exceeds a certain value

The notification e-mails can be triggered when a certain warning value is reached (*MEMUSAGE_WARNING_MB*) and when the maximum value is reached (*MEMUSAGE_LIMIT_MB*) which will also cause the spider to be closed and the Scrapy process to be terminated.

This extension is enabled by the *MEMUSAGE_ENABLED* setting and can be configured with the following settings:

- *MEMUSAGE_LIMIT_MB*
- *MEMUSAGE_WARNING_MB*
- *MEMUSAGE_NOTIFY_MAIL*
- *MEMUSAGE_CHECK_INTERVAL_SECONDS*

Memory debugger extension

class scrapy.extensions.memdebug.**MemoryDebugger**

An extension for debugging memory usage. It collects information about:

- objects uncollected by the Python garbage collector
- objects left alive that shouldn't. For more info, see *Debugging memory leaks with trackref*

To enable this extension, turn on the *MEMDEBUG_ENABLED* setting. The info will be stored in the stats.

Spider state extension

class scrapy.extensions.spiderstate.**SpiderState**

Manages spider state data by loading it before a crawl and saving it after.

Give a value to the *JOBDIR* setting to enable this extension. When enabled, this extension manages the *state* attribute of your *Spider* instance:

- When your spider closes (*spider_closed*), the contents of its *state* attribute are serialized into a file named `spider.state` in the *JOBDIR* folder.
- When your spider opens (*spider_opened*), if a previously-generated `spider.state` file exists in the *JOBDIR* folder, it is loaded into the *state* attribute.

For an example, see *Keeping persistent state between batches*.

Close spider extension

class scrapy.extensions.closespider.**CloseSpider**

Closes a spider automatically when some conditions are met, using a specific closing reason for each condition.

The conditions for closing a spider can be configured through the following settings:

- *CLOSESPIDER_TIMEOUT*
- *CLOSESPIDER_TIMEOUT_NO_ITEM*
- *CLOSESPIDER_ITEMCOUNT*
- *CLOSESPIDER_PAGECOUNT*
- *CLOSESPIDER_ERRORCOUNT*

Note

When a certain closing condition is met, requests which are currently in the downloader queue (up to *CONCURRENT_REQUESTS* requests) are still processed.

CLOSESPIDER_TIMEOUT

Default: `0`

An integer which specifies a number of seconds. If the spider remains open for more than that number of second, it will be automatically closed with the reason `closespider_timeout`. If zero (or non set), spiders won't be closed by timeout.

CLOSESPIDER_TIMEOUT_NO_ITEM

Default: `0`

An integer which specifies a number of seconds. If the spider has not produced any items in the last number of seconds, it will be closed with the reason `closespider_timeout_no_item`. If zero (or non set), spiders won't be closed regardless if it hasn't produced any items.

CLOSESPIDER_ITEMCOUNT

Default: `0`

An integer which specifies a number of items. If the spider scrapes more than that amount and those items are passed by the item pipeline, the spider will be closed with the reason `closespider_itemcount`. If zero (or non set), spiders won't be closed by number of passed items.

CLOSESPIDER_PAGECOUNT

Default: `0`

An integer which specifies the maximum number of responses to crawl. If the spider crawls more than that, the spider will be closed with the reason `closespider_pagecount`. If zero (or non set), spiders won't be closed by number of crawled responses.

CLOSESPIDER_PAGECOUNT_NO_ITEM

Default: `0`

An integer which specifies the maximum number of consecutive responses to crawl without items scraped. If the spider crawls more consecutive responses than that and no items are scraped in the meantime, the spider will be closed with the reason `closespider_pagecount_no_item`. If zero (or not set), spiders won't be closed by number of crawled responses with no items.

CLOSESPIDER_ERRORCOUNT

Default: `0`

An integer which specifies the maximum number of errors to receive before closing the spider. If the spider generates more than that number of errors, it will be closed with the reason `closespider_errorcount`. If zero (or non set), spiders won't be closed by number of errors.

StatsMailer extension

class scrapy.extensions.statsmailer.**StatsMailer**

This simple extension can be used to send a notification e-mail every time a domain has finished scraping, including the Scrapy stats collected. The email will be sent to all recipients specified in the *STATSMAILER_RCPTS* setting.

Emails can be sent using the *MailSender* class. To see a full list of parameters, including examples on how to instantiate *MailSender* and use mail settings, see *Sending e-mail*.

Periodic log extension

class scrapy.extensions.periodic_log.**PeriodicLog**

This extension periodically logs rich stat data as a JSON object:

```
2023-08-04 02:30:57 [scrapy.extensions.logstats] INFO: Crawled 976 pages (at 162 pages/
↪min), scraped 925 items (at 161 items/min)
2023-08-04 02:30:57 [scrapy.extensions.periodic_log] INFO: {
    "delta": {
        "downloader/request_bytes": 55582,
        "downloader/request_count": 162,
        "downloader/request_method_count/GET": 162,
        "downloader/response_bytes": 618133,
        "downloader/response_count": 162,
        "downloader/response_status_count/200": 162,
        "item_scraped_count": 161
    },
    "stats": {
        "downloader/request_bytes": 338243,
        "downloader/request_count": 992,
        "downloader/request_method_count/GET": 992,
        "downloader/response_bytes": 3836736,
        "downloader/response_count": 976,
        "downloader/response_status_count/200": 976,
        "item_scraped_count": 925,
        "log_count/INFO": 21,
        "log_count/WARNING": 1,
        "scheduler/dequeued": 992,
        "scheduler/dequeued/memory": 992,
        "scheduler/enqueued": 1050,
        "scheduler/enqueued/memory": 1050
    },
    "time": {
        "elapsed": 360.008903,
        "log_interval": 60.0,
        "log_interval_real": 60.006694,
        "start_time": "2023-08-03 23:24:57",
        "utcnow": "2023-08-03 23:30:57"
    }
}
```

This extension logs the following configurable sections:

- `"delta"` shows how some numeric stats have changed since the last stats log message.

  The *PERIODIC_LOG_DELTA* setting determines the target stats. They must have `int` or `float` values.

- `"stats"` shows the current value of some stats.

  The *PERIODIC_LOG_STATS* setting determines the target stats.

- `"time"` shows detailed timing data.

  The *PERIODIC_LOG_TIMING_ENABLED* setting determines whether or not to show this section.

This extension logs data at the start, then on a fixed time interval configurable through the *LOGSTATS_INTERVAL* setting, and finally right before the crawl ends.

Example extension configuration:

```
custom_settings = {
    "LOG_LEVEL": "INFO",
```

(continues on next page)

(continued from previous page)

```
    "PERIODIC_LOG_STATS": {
        "include": ["downloader/", "scheduler/", "log_count/", "item_scraped_count/"],
    },
    "PERIODIC_LOG_DELTA": {"include": ["downloader/"]},
    "PERIODIC_LOG_TIMING_ENABLED": True,
    "EXTENSIONS": {
        "scrapy.extensions.periodic_log.PeriodicLog": 0,
    },
}
```

PERIODIC_LOG_DELTA

Default: `None`

- `"PERIODIC_LOG_DELTA": True` - show deltas for all `int` and `float` stat values.
- `"PERIODIC_LOG_DELTA": {"include": ["downloader/", "scheduler/"]}` - show deltas for stats with names containing any configured substring.
- `"PERIODIC_LOG_DELTA": {"exclude": ["downloader/"]}` - show deltas for all stats with names not containing any configured substring.

PERIODIC_LOG_STATS

Default: `None`

- `"PERIODIC_LOG_STATS": True` - show the current value of all stats.
- `"PERIODIC_LOG_STATS": {"include": ["downloader/", "scheduler/"]}` - show current values for stats with names containing any configured substring.
- `"PERIODIC_LOG_STATS": {"exclude": ["downloader/"]}` - show current values for all stats with names not containing any configured substring.

PERIODIC_LOG_TIMING_ENABLED

Default: `False`

`True` enables logging of timing data (i.e. the `"time"` section).

Debugging extensions

Stack trace dump extension

class scrapy.extensions.periodic_log.**StackTraceDump**

Dumps information about the running process when a SIGQUIT or SIGUSR2 signal is received. The information dumped is the following:

1. engine status (using `scrapy.utils.engine.get_engine_status()`)
2. live references (see *Debugging memory leaks with trackref*)
3. stack trace of all threads

After the stack trace and engine status is dumped, the Scrapy process continues running normally.

This extension only works on POSIX-compliant platforms (i.e. not Windows), because the SIGQUIT and SIGUSR2 signals are not available on Windows.

There are at least two ways to send Scrapy the SIGQUIT signal:

1. By pressing Ctrl-while a Scrapy process is running (Linux only?)
2. By running this command (assuming <pid> is the process id of the Scrapy process):

```
kill -QUIT <pid>
```

Debugger extension

class scrapy.extensions.periodic_log.**Debugger**

Invokes a Python debugger inside a running Scrapy process when a SIGUSR2 signal is received. After the debugger is exited, the Scrapy process continues running normally.

This extension only works on POSIX-compliant platforms (i.e. not Windows).

6.6 Signals

Scrapy uses signals extensively to notify when certain events occur. You can catch some of those signals in your Scrapy project (using an *extension*, for example) to perform additional tasks or extend Scrapy to add functionality not provided out of the box.

Even though signals provide several arguments, the handlers that catch them don't need to accept all of them - the signal dispatching mechanism will only deliver the arguments that the handler receives.

You can connect to signals (or send your own) through the *Signals API*.

Here is a simple example showing how you can catch signals and perform some action:

```
from scrapy import signals
from scrapy import Spider

class DmozSpider(Spider):
    name = "dmoz"
    allowed_domains = ["dmoz.org"]
    start_urls = [
        "http://www.dmoz.org/Computers/Programming/Languages/Python/Books/",
        "http://www.dmoz.org/Computers/Programming/Languages/Python/Resources/",
    ]

    @classmethod
    def from_crawler(cls, crawler, *args, **kwargs):
        spider = super(DmozSpider, cls).from_crawler(crawler, *args, **kwargs)
        crawler.signals.connect(spider.spider_closed, signal=signals.spider_closed)
        return spider

    def spider_closed(self, spider):
        spider.logger.info("Spider closed: %s", spider.name)

    def parse(self, response):
        pass
```

6.6.1 Deferred signal handlers

Some signals support returning `Deferred` or awaitable objects from their handlers, allowing you to run asynchronous code that does not block Scrapy. If a signal handler returns one of these objects, Scrapy waits for that asynchronous operation to finish.

Let's take an example using *coroutines*:

```
import scrapy

class SignalSpider(scrapy.Spider):
    name = "signals"
    start_urls = ["https://quotes.toscrape.com/page/1/"]

    @classmethod
    def from_crawler(cls, crawler, *args, **kwargs):
        spider = super(SignalSpider, cls).from_crawler(crawler, *args, **kwargs)
        crawler.signals.connect(spider.item_scraped, signal=signals.item_scraped)
        return spider

    async def item_scraped(self, item):
        # Send the scraped item to the server
        response = await treq.post(
            "http://example.com/post",
            json.dumps(item).encode("ascii"),
            headers={b"Content-Type": [b"application/json"]},
        )

        return response

    def parse(self, response):
        for quote in response.css("div.quote"):
            yield {
                "text": quote.css("span.text::text").get(),
                "author": quote.css("small.author::text").get(),
                "tags": quote.css("div.tags a.tag::text").getall(),
            }
```

See the *Built-in signals reference* below to know which signals support `Deferred` and awaitable objects.

6.6.2 Built-in signals reference

Here's the list of Scrapy built-in signals and their meaning.

Engine signals

engine_started

scrapy.signals.**engine_started**()

Sent when the Scrapy engine has started crawling.

This signal supports returning deferreds from its handlers.

> **Note**
>
> This signal may be fired *after* the `spider_opened` signal, depending on how the spider was started. So **don't** rely on this signal getting fired before `spider_opened`.

engine_stopped

`scrapy.signals.`**`engine_stopped`**`()`

Sent when the Scrapy engine is stopped (for example, when a crawling process has finished).

This signal supports returning deferreds from its handlers.

scheduler_empty

`scrapy.signals.`**`scheduler_empty`**`()`

Sent whenever the engine asks for a pending request from the *scheduler* (i.e. calls its `next_request()` method) and the scheduler returns none.

See *Delaying start request iteration* for an example.

Item signals

> **Note**
>
> As at max `CONCURRENT_ITEMS` items are processed in parallel, many deferreds are fired together using `DeferredList`. Hence the next batch waits for the `DeferredList` to fire and then runs the respective item signal handler for the next batch of scraped items.

item_scraped

`scrapy.signals.`**`item_scraped`**`(`*item*, *response*, *spider*`)`

Sent when an item has been scraped, after it has passed all the *Item Pipeline* stages (without being dropped).

This signal supports returning deferreds from its handlers.

Parameters

- **`item`** (*item object*) – the scraped item
- **`spider`** (`Spider` object) – the spider which scraped the item
- **`response`** (`Response` | `None`) – the response from where the item was scraped, or `None` if it was yielded from `start()`.

item_dropped

`scrapy.signals.`**`item_dropped`**`(`*item*, *response*, *exception*, *spider*`)`

Sent after an item has been dropped from the *Item Pipeline* when some stage raised a `DropItem` exception.

This signal supports returning deferreds from its handlers.

Parameters

- **`item`** (*item object*) – the item dropped from the *Item Pipeline*
- **`spider`** (`Spider` object) – the spider which scraped the item

- **response** (*Response* | None) – the response from where the item was dropped, or None if it was yielded from *start()*.
- **exception** (*DropItem* exception) – the exception (which must be a *DropItem* subclass) which caused the item to be dropped

item_error

scrapy.signals.**item_error**(*item*, *response*, *spider*, *failure*)

Sent when a *Item Pipeline* generates an error (i.e. raises an exception), except *DropItem* exception.

This signal supports returning deferreds from its handlers.

Parameters

- **item** (*item object*) – the item that caused the error in the *Item Pipeline*
- **response** (*Response* | None) – the response being processed when the exception was raised, or None if it was yielded from *start()*.
- **spider** (*Spider* object) – the spider which raised the exception
- **failure** (*twisted.python.failure.Failure*) – the exception raised

Spider signals

spider_closed

scrapy.signals.**spider_closed**(*spider*, *reason*)

Sent after a spider has been closed. This can be used to release per-spider resources reserved on *spider_opened*.

This signal supports returning deferreds from its handlers.

Parameters

- **spider** (*Spider* object) – the spider which has been closed
- **reason** (*str*) – a string which describes the reason why the spider was closed. If it was closed because the spider has completed scraping, the reason is 'finished'. Otherwise, if the spider was manually closed by calling the close_spider engine method, then the reason is the one passed in the reason argument of that method (which defaults to 'cancelled'). If the engine was shutdown (for example, by hitting Ctrl-C to stop it) the reason will be 'shutdown'.

spider_opened

scrapy.signals.**spider_opened**(*spider*)

Sent after a spider has been opened for crawling. This is typically used to reserve per-spider resources, but can be used for any task that needs to be performed when a spider is opened.

This signal supports returning deferreds from its handlers.

Parameters

spider (*Spider* object) – the spider which has been opened

spider_idle

scrapy.signals.**spider_idle**(*spider*)

Sent when a spider has gone idle, which means the spider has no further:

- requests waiting to be downloaded

- requests scheduled
- items being processed in the item pipeline

If the idle state persists after all handlers of this signal have finished, the engine starts closing the spider. After the spider has finished closing, the *spider_closed* signal is sent.

You may raise a *DontCloseSpider* exception to prevent the spider from being closed.

Alternatively, you may raise a *CloseSpider* exception to provide a custom spider closing reason. An idle handler is the perfect place to put some code that assesses the final spider results and update the final closing reason accordingly (e.g. setting it to 'too_few_results' instead of 'finished').

This signal does not support returning deferreds from its handlers.

Parameters
spider (*Spider* object) – the spider which has gone idle

Note

Scheduling some requests in your *spider_idle* handler does **not** guarantee that it can prevent the spider from being closed, although it sometimes can. That's because the spider may still remain idle if all the scheduled requests are rejected by the scheduler (e.g. filtered due to duplication).

spider_error

`scrapy.signals.spider_error(failure, response, spider)`

Sent when a spider callback generates an error (i.e. raises an exception).

This signal does not support returning deferreds from its handlers.

Parameters

- **failure** (*twisted.python.failure.Failure*) – the exception raised
- **response** (*Response* object) – the response being processed when the exception was raised
- **spider** (*Spider* object) – the spider which raised the exception

feed_slot_closed

`scrapy.signals.feed_slot_closed(slot)`

Sent when a *feed exports* slot is closed.

This signal supports returning deferreds from its handlers.

Parameters
slot (*scrapy.extensions.feedexport.FeedSlot*) – the slot closed

feed_exporter_closed

`scrapy.signals.feed_exporter_closed()`

Sent when the *feed exports* extension is closed, during the handling of the *spider_closed* signal by the extension, after all feed exporting has been handled.

This signal supports returning deferreds from its handlers.

Request signals

request_scheduled

scrapy.signals.**request_scheduled**(*request*, *spider*)

Sent when the engine is asked to schedule a *Request*, to be downloaded later, before the request reaches the *scheduler*.

Raise *IgnoreRequest* to drop a request before it reaches the scheduler.

This signal does not support returning deferreds from its handlers.

Added in version 2.11.2: Allow dropping requests with *IgnoreRequest*.

Parameters

- **request** (*Request* object) – the request that reached the scheduler
- **spider** (*Spider* object) – the spider that yielded the request

request_dropped

scrapy.signals.**request_dropped**(*request*, *spider*)

Sent when a *Request*, scheduled by the engine to be downloaded later, is rejected by the scheduler.

This signal does not support returning deferreds from its handlers.

Parameters

- **request** (*Request* object) – the request that reached the scheduler
- **spider** (*Spider* object) – the spider that yielded the request

request_reached_downloader

scrapy.signals.**request_reached_downloader**(*request*, *spider*)

Sent when a *Request* reached downloader.

This signal does not support returning deferreds from its handlers.

Parameters

- **request** (*Request* object) – the request that reached downloader
- **spider** (*Spider* object) – the spider that yielded the request

request_left_downloader

scrapy.signals.**request_left_downloader**(*request*, *spider*)

Added in version 2.0.

Sent when a *Request* leaves the downloader, even in case of failure.

This signal does not support returning deferreds from its handlers.

Parameters

- **request** (*Request* object) – the request that reached the downloader
- **spider** (*Spider* object) – the spider that yielded the request

bytes_received

Added in version 2.2.

scrapy.signals.**bytes_received**(*data*, *request*, *spider*)

Sent by the HTTP 1.1 and S3 download handlers when a group of bytes is received for a specific request. This signal might be fired multiple times for the same request, with partial data each time. For instance, a possible scenario for a 25 kb response would be two signals fired with 10 kb of data, and a final one with 5 kb of data.

Handlers for this signal can stop the download of a response while it is in progress by raising the *StopDownload* exception. Please refer to the *Stopping the download of a Response* topic for additional information and examples.

This signal does not support returning deferreds from its handlers.

Parameters

- **data** (bytes object) – the data received by the download handler
- **request** (*Request* object) – the request that generated the download
- **spider** (*Spider* object) – the spider associated with the response

headers_received

Added in version 2.5.

scrapy.signals.**headers_received**(*headers*, *body_length*, *request*, *spider*)

Sent by the HTTP 1.1 and S3 download handlers when the response headers are available for a given request, before downloading any additional content.

Handlers for this signal can stop the download of a response while it is in progress by raising the *StopDownload* exception. Please refer to the *Stopping the download of a Response* topic for additional information and examples.

This signal does not support returning deferreds from its handlers.

Parameters

- **headers** (scrapy.http.headers.Headers object) – the headers received by the download handler
- **body_length** (*int*) – expected size of the response body, in bytes
- **request** (*Request* object) – the request that generated the download
- **spider** (*Spider* object) – the spider associated with the response

Response signals

response_received

scrapy.signals.**response_received**(*response*, *request*, *spider*)

Sent when the engine receives a new *Response* from the downloader.

This signal does not support returning deferreds from its handlers.

Parameters

- **response** (*Response* object) – the response received
- **request** (*Request* object) – the request that generated the response
- **spider** (*Spider* object) – the spider for which the response is intended

Note

The `request` argument might not contain the original request that reached the downloader, if a *Downloader Middleware* modifies the `Response` object and sets a specific `request` attribute.

response_downloaded

`scrapy.signals.response_downloaded(response, request, spider)`

Sent by the downloader right after a `HTTPResponse` is downloaded.

This signal does not support returning deferreds from its handlers.

Parameters

- **response** (`Response` object) – the response downloaded
- **request** (`Request` object) – the request that generated the response
- **spider** (`Spider` object) – the spider for which the response is intended

6.7 Scheduler

The scheduler component receives requests from the *engine* and stores them into persistent and/or non-persistent data structures. It also gets those requests and feeds them back to the engine when it asks for a next request to be downloaded.

6.7.1 Overriding the default scheduler

You can use your own custom scheduler class by supplying its full Python path in the `SCHEDULER` setting.

6.7.2 Minimal scheduler interface

`class scrapy.core.scheduler.BaseScheduler`

The scheduler component is responsible for storing requests received from the engine, and feeding them back upon request (also to the engine).

The original sources of said requests are:

- Spider: `start` method, requests created for URLs in the `start_urls` attribute, request callbacks
- Spider middleware: `process_spider_output` and `process_spider_exception` methods
- Downloader middleware: `process_request`, `process_response` and `process_exception` methods

The order in which the scheduler returns its stored requests (via the `next_request` method) plays a great part in determining the order in which those requests are downloaded. See *Request order*.

The methods defined in this class constitute the minimal interface that the Scrapy engine will interact with.

`close(reason: str) → Deferred[None] | None`

Called when the spider is closed by the engine. It receives the reason why the crawl finished as argument and it's useful to execute cleaning code.

Parameters

reason (`str`) – a string which describes the reason why the spider was closed

abstract enqueue_request(*request:* Request) → bool

Process a request received by the engine.

Return `True` if the request is stored correctly, `False` otherwise.

If `False`, the engine will fire a `request_dropped` signal, and will not make further attempts to schedule the request at a later time. For reference, the default Scrapy scheduler returns `False` when the request is rejected by the dupefilter.

classmethod from_crawler(*crawler:* Crawler) → Self

Factory method which receives the current *Crawler* object as argument.

abstract has_pending_requests() → bool

`True` if the scheduler has enqueued requests, `False` otherwise

abstract next_request() → *Request* | None

Return the next *Request* to be processed, or `None` to indicate that there are no requests to be considered ready at the moment.

Returning `None` implies that no request from the scheduler will be sent to the downloader in the current reactor cycle. The engine will continue calling `next_request` until `has_pending_requests` is `False`.

open(*spider:* Spider) → Deferred[None] | None

Called when the spider is opened by the engine. It receives the spider instance as argument and it's useful to execute initialization code.

Parameters
spider (*Spider*) – the spider object for the current crawl

6.7.3 Default scheduler

class scrapy.core.scheduler.**Scheduler**

Default scheduler.

Requests are stored into priority queues (*SCHEDULER_PRIORITY_QUEUE*) that sort requests by `priority`.

By default, a single, memory-based priority queue is used for all requests. When using *JOBDIR*, a disk-based priority queue is also created, and only unserializable requests are stored in the memory-based priority queue. For a given priority value, requests in memory take precedence over requests in disk.

Each priority queue stores requests in separate internal queues, one per priority value. The memory priority queue uses *SCHEDULER_MEMORY_QUEUE* queues, while the disk priority queue uses *SCHEDULER_DISK_QUEUE* queues. The internal queues determine *request order* when requests have the same priority. *Start requests* are stored into separate internal queues by default, and *ordered differently*.

Duplicate requests are filtered out with an instance of *DUPEFILTER_CLASS*.

Request order

With default settings, pending requests are stored in a LIFO queue (*except for start requests*). As a result, crawling happens in DFO order, which is usually the most convenient crawl order. However, you can enforce *BFO* or *a custom order* (*except for the first few requests*).

Start request order

Start requests are sent in the order they are yielded from *start()*, and given the same `priority`, other requests take precedence over start requests.

You can set *SCHEDULER_START_MEMORY_QUEUE* and *SCHEDULER_START_DISK_QUEUE* to `None` to handle start requests the same as other requests when it comes to order and priority.

Crawling in BFO order

If you do want to crawl in BFO order, you can do it by setting the following *settings*:

```
DEPTH_PRIORITY = 1
SCHEDULER_DISK_QUEUE = "scrapy.squeues.PickleFifoDiskQueue"
SCHEDULER_MEMORY_QUEUE = "scrapy.squeues.FifoMemoryQueue"
```

Crawling in a custom order

You can manually set `priority` on requests to force a specific request order.

Concurrency affects order

While pending requests are below the configured values of *CONCURRENT_REQUESTS*, *CONCURRENT_REQUESTS_PER_DOMAIN* or *CONCURRENT_REQUESTS_PER_IP*, those requests are sent concurrently.

As a result, the first few requests of a crawl may not follow the desired order. Lowering those settings to 1 enforces the desired order except for the very first request, but it significantly slows down the crawl as a whole.

__init__(*dupefilter:* BaseDupeFilter, *jobdir:* *str* | *None* = *None*, *dqclass:* *type[BaseQueue]* | *None* = *None*, *mqclass:* *type[BaseQueue]* | *None* = *None*, *logunser:* *bool* = *False*, *stats:* StatsCollector | *None* = *None*, *pqclass:* *type[ScrapyPriorityQueue]* | *None* = *None*, *crawler:* Crawler | *None* = *None*)

Initialize the scheduler.

Parameters

- **dupefilter** (*scrapy.dupefilters.BaseDupeFilter* instance or similar: any class that implements the *BaseDupeFilter* interface) – An object responsible for checking and filtering duplicate requests. The value for the *DUPEFILTER_CLASS* setting is used by default.
- **jobdir** (`str` or `None`) – The path of a directory to be used for persisting the crawl's state. The value for the *JOBDIR* setting is used by default. See *Jobs: pausing and resuming crawls*.
- **dqclass** (*class*) – A class to be used as persistent request queue. The value for the *SCHEDULER_DISK_QUEUE* setting is used by default.
- **mqclass** (*class*) – A class to be used as non-persistent request queue. The value for the *SCHEDULER_MEMORY_QUEUE* setting is used by default.
- **logunser** (*bool*) – A boolean that indicates whether or not unserializable requests should be logged. The value for the *SCHEDULER_DEBUG* setting is used by default.
- **stats** (*scrapy.statscollectors.StatsCollector* instance or similar: any class that implements the *StatsCollector* interface) – A stats collector object to record stats about the request scheduling process. The value for the *STATS_CLASS* setting is used by default.
- **pqclass** (*class*) – A class to be used as priority queue for requests. The value for the *SCHEDULER_PRIORITY_QUEUE* setting is used by default.
- **crawler** (*scrapy.crawler.Crawler*) – The crawler object corresponding to the current crawl.

__len__() → int

Return the total amount of enqueued requests

close(*reason: str*) → Deferred[None] | None

(1) dump pending requests to disk if there is a disk queue

(2) return the result of the dupefilter's `close` method

enqueue_request(*request:* Request) → bool

Unless the received request is filtered out by the Dupefilter, attempt to push it into the disk queue, falling back to pushing it into the memory queue.

Increment the appropriate stats, such as: `scheduler/enqueued`, `scheduler/enqueued/disk`, `scheduler/enqueued/memory`.

Return `True` if the request was stored successfully, `False` otherwise.

classmethod from_crawler(*crawler:* Crawler) → Self

Factory method which receives the current *Crawler* object as argument.

has_pending_requests() → bool

`True` if the scheduler has enqueued requests, `False` otherwise

next_request() → *Request* | None

Return a *Request* object from the memory queue, falling back to the disk queue if the memory queue is empty. Return `None` if there are no more enqueued requests.

Increment the appropriate stats, such as: `scheduler/dequeued`, `scheduler/dequeued/disk`, `scheduler/dequeued/memory`.

open(*spider:* Spider) → Deferred[None] | None

(1) initialize the memory queue

(2) initialize the disk queue if the `jobdir` attribute is a valid directory

(3) return the result of the dupefilter's `open` method

6.8 Item Exporters

Once you have scraped your items, you often want to persist or export those items, to use the data in some other application. That is, after all, the whole purpose of the scraping process.

For this purpose Scrapy provides a collection of Item Exporters for different output formats, such as XML, CSV or JSON.

6.8.1 Using Item Exporters

If you are in a hurry, and just want to use an Item Exporter to output scraped data see the *Feed exports*. Otherwise, if you want to know how Item Exporters work or need more custom functionality (not covered by the default exports), continue reading below.

In order to use an Item Exporter, you must instantiate it with its required args. Each Item Exporter requires different arguments, so check each exporter documentation to be sure, in *Built-in Item Exporters reference*. After you have instantiated your exporter, you have to:

1. call the method *start_exporting()* in order to signal the beginning of the exporting process

2. call the *export_item()* method for each item you want to export

3. and finally call the *finish_exporting()* to signal the end of the exporting process

Here you can see an *Item Pipeline* which uses multiple Item Exporters to group scraped items to different files according to the value of one of their fields:

```
from itemadapter import ItemAdapter
from scrapy.exporters import XmlItemExporter

class PerYearXmlExportPipeline:
    """Distribute items across multiple XML files according to their 'year' field"""

    def open_spider(self, spider):
        self.year_to_exporter = {}

    def close_spider(self, spider):
        for exporter, xml_file in self.year_to_exporter.values():
            exporter.finish_exporting()
            xml_file.close()

    def _exporter_for_item(self, item):
        adapter = ItemAdapter(item)
        year = adapter["year"]
        if year not in self.year_to_exporter:
            xml_file = open(f"{year}.xml", "wb")
            exporter = XmlItemExporter(xml_file)
            exporter.start_exporting()
            self.year_to_exporter[year] = (exporter, xml_file)
        return self.year_to_exporter[year][0]

    def process_item(self, item, spider):
        exporter = self._exporter_for_item(item)
        exporter.export_item(item)
        return item
```

6.8.2 Serialization of item fields

By default, the field values are passed unmodified to the underlying serialization library, and the decision of how to serialize them is delegated to each particular serialization library.

However, you can customize how each field value is serialized *before it is passed to the serialization library*.

There are two ways to customize how a field will be serialized, which are described next.

1. Declaring a serializer in the field

If you use *Item* you can declare a serializer in the *field metadata*. The serializer must be a callable which receives a value and returns its serialized form.

Example:

```
import scrapy

def serialize_price(value):
    return f"$ {str(value)}"
```

(continues on next page)

(continued from previous page)

```
class Product(scrapy.Item):
    name = scrapy.Field()
    price = scrapy.Field(serializer=serialize_price)
```

2. Overriding the serialize_field() method

You can also override the *serialize_field()* method to customize how your field value will be exported.

Make sure you call the base class *serialize_field()* method after your custom code.

Example:

```
from scrapy.exporters import XmlItemExporter

class ProductXmlExporter(XmlItemExporter):
    def serialize_field(self, field, name, value):
        if name == "price":
            return f"$ {str(value)}"
        return super().serialize_field(field, name, value)
```

6.8.3 Built-in Item Exporters reference

Here is a list of the Item Exporters bundled with Scrapy. Some of them contain output examples, which assume you're exporting these two items:

```
Item(name="Color TV", price="1200")
Item(name="DVD player", price="200")
```

BaseItemExporter

class scrapy.exporters.**BaseItemExporter**(*fields_to_export=None*, *export_empty_fields=False*, *encoding='utf-8'*, *indent=0*, *dont_fail=False*)

This is the (abstract) base class for all Item Exporters. It provides support for common features used by all (concrete) Item Exporters, such as defining what fields to export, whether to export empty fields, or which encoding to use.

These features can be configured through the `__init__` method arguments which populate their respective instance attributes: *fields_to_export*, *export_empty_fields*, *encoding*, *indent*.

Added in version 2.0: The *dont_fail* parameter.

export_item(*item*)

Exports the given item. This method must be implemented in subclasses.

serialize_field(*field*, *name*, *value*)

Return the serialized value for the given field. You can override this method (in your custom Item Exporters) if you want to control how a particular field or value will be serialized/exported.

By default, this method looks for a serializer *declared in the item field* and returns the result of applying that serializer to the value. If no serializer is found, it returns the value unchanged.

Parameters

- **field** (*Field* object or a `dict` instance) – the field being serialized. If the source *item object* does not define field metadata, *field* is an empty `dict`.
- **name** (*str*) – the name of the field being serialized
- **value** – the value being serialized

start_exporting()

Signal the beginning of the exporting process. Some exporters may use this to generate some required header (for example, the *XmlItemExporter*). You must call this method before exporting any items.

finish_exporting()

Signal the end of the exporting process. Some exporters may use this to generate some required footer (for example, the *XmlItemExporter*). You must always call this method after you have no more items to export.

fields_to_export

Fields to export, their order[1] and their output names.

Possible values are:

- `None` (all fields[2], default)
- A list of fields:

```
['field1', 'field2']
```

- A dict where keys are fields and values are output names:

```
{'field1': 'Field 1', 'field2': 'Field 2'}
```

export_empty_fields

Whether to include empty/unpopulated item fields in the exported data. Defaults to `False`. Some exporters (like *CsvItemExporter*) ignore this attribute and always export all empty fields.

This option is ignored for dict items.

encoding

The output character encoding.

indent

Amount of spaces used to indent the output on each level. Defaults to `0`.

- `indent=None` selects the most compact representation, all items in the same line with no indentation
- `indent<=0` each item on its own line, no indentation
- `indent>0` each item on its own line, indented with the provided numeric value

PythonItemExporter

class scrapy.exporters.**PythonItemExporter**(*, *dont_fail: bool = False*, ***kwargs: Any*)

This is a base class for item exporters that extends *BaseItemExporter* with support for nested items.

It serializes items to built-in Python types, so that any serialization library (e.g. `json` or msgpack) can be used on top of it.

[1] Not all exporters respect the specified field order.

[2] When using *item objects* that do not expose all their possible fields, exporters that do not support exporting a different subset of fields per item will only export the fields found in the first item exported.

XmlItemExporter

class scrapy.exporters.**XmlItemExporter**(*file*, *item_element='item'*, *root_element='items'*, ***kwargs*)

Exports items in XML format to the specified file object.

Parameters

- **file** – the file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `io.BytesIO` object, etc)
- **root_element** (*str*) – The name of root element in the exported XML.
- **item_element** (*str*) – The name of each item element in the exported XML.

The additional keyword arguments of this `__init__` method are passed to the *BaseItemExporter* `__init__` method.

A typical output of this exporter would be:

```
<?xml version="1.0" encoding="utf-8"?>
<items>
  <item>
    <name>Color TV</name>
    <price>1200</price>
 </item>
  <item>
    <name>DVD player</name>
    <price>200</price>
 </item>
</items>
```

Unless overridden in the `serialize_field()` method, multi-valued fields are exported by serializing each value inside a `<value>` element. This is for convenience, as multi-valued fields are very common.

For example, the item:

```
Item(name=['John', 'Doe'], age='23')
```

Would be serialized as:

```
<?xml version="1.0" encoding="utf-8"?>
<items>
  <item>
    <name>
      <value>John</value>
      <value>Doe</value>
    </name>
    <age>23</age>
  </item>
</items>
```

CsvItemExporter

class scrapy.exporters.**CsvItemExporter**(*file*, *include_headers_line=True*, *join_multivalued=','*, *errors=None*, ***kwargs*)

Exports items in CSV format to the given file-like object. If the `fields_to_export` attribute is set, it will be used to define the CSV columns, their order and their column names. The `export_empty_fields` attribute has no effect on this exporter.

Parameters

- **file** – the file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `io.BytesIO` object, etc)
- **include_headers_line** (*str*) – If enabled, makes the exporter output a header line with the field names taken from *BaseItemExporter.fields_to_export* or the first exported item fields.
- **join_multivalued** – The char (or chars) that will be used for joining multi-valued fields, if found.
- **errors** (*str*) – The optional string that specifies how encoding and decoding errors are to be handled. For more information see `io.TextIOWrapper`.

The additional keyword arguments of this `__init__` method are passed to the *BaseItemExporter* `__init__` method, and the leftover arguments to the `csv.writer()` function, so you can use any `csv.writer()` function argument to customize this exporter.

A typical output of this exporter would be:

```
product,price
Color TV,1200
DVD player,200
```

PickleItemExporter

class scrapy.exporters.**PickleItemExporter**(*file*, *protocol=0*, ***kwargs*)

Exports items in pickle format to the given file-like object.

Parameters

- **file** – the file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `io.BytesIO` object, etc)
- **protocol** (*int*) – The pickle protocol to use.

For more information, see `pickle`.

The additional keyword arguments of this `__init__` method are passed to the *BaseItemExporter* `__init__` method.

Pickle isn't a human readable format, so no output examples are provided.

PprintItemExporter

class scrapy.exporters.**PprintItemExporter**(*file*, ***kwargs*)

Exports items in pretty print format to the specified file object.

Parameters

file – the file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `io.BytesIO` object, etc)

The additional keyword arguments of this `__init__` method are passed to the *BaseItemExporter* `__init__` method.

A typical output of this exporter would be:

```
{'name': 'Color TV', 'price': '1200'}
{'name': 'DVD player', 'price': '200'}
```

Longer lines (when present) are pretty-formatted.

JsonItemExporter

class scrapy.exporters.**JsonItemExporter**(*file*, ***kwargs*)

Exports items in JSON format to the specified file-like object, writing all objects as a list of objects. The additional `__init__` method arguments are passed to the *BaseItemExporter* `__init__` method, and the leftover arguments to the `JSONEncoder` `__init__` method, so you can use any `JSONEncoder` `__init__` method argument to customize this exporter.

Parameters

file – the file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `io.BytesIO` object, etc)

A typical output of this exporter would be:

```
[{"name": "Color TV", "price": "1200"},
{"name": "DVD player", "price": "200"}]
```

Warning

JSON is very simple and flexible serialization format, but it doesn't scale well for large amounts of data since incremental (aka. stream-mode) parsing is not well supported (if at all) among JSON parsers (on any language), and most of them just parse the entire object in memory. If you want the power and simplicity of JSON with a more stream-friendly format, consider using *JsonLinesItemExporter* instead, or splitting the output in multiple chunks.

JsonLinesItemExporter

class scrapy.exporters.**JsonLinesItemExporter**(*file*, ***kwargs*)

Exports items in JSON format to the specified file-like object, writing one JSON-encoded item per line. The additional `__init__` method arguments are passed to the *BaseItemExporter* `__init__` method, and the leftover arguments to the `JSONEncoder` `__init__` method, so you can use any `JSONEncoder` `__init__` method argument to customize this exporter.

Parameters

file – the file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `io.BytesIO` object, etc)

A typical output of this exporter would be:

```
{"name": "Color TV", "price": "1200"}
{"name": "DVD player", "price": "200"}
```

Unlike the one produced by *JsonItemExporter*, the format produced by this exporter is well suited for serializing large amounts of data.

MarshalItemExporter

class scrapy.exporters.**MarshalItemExporter**(*file: BytesIO*, ***kwargs: Any*)

Exports items in a Python-specific binary format (see `marshal`).

Parameters

file – The file-like object to use for exporting the data. Its `write` method should accept `bytes` (a disk file opened in binary mode, a `BytesIO` object, etc)

6.9 Components

A Scrapy component is any class whose objects are built using *build_from_crawler()*.

That includes the classes that you may assign to the following settings:

- *ADDONS*
- *DNS_RESOLVER*
- *DOWNLOAD_HANDLERS*
- *DOWNLOADER_CLIENTCONTEXTFACTORY*
- *DOWNLOADER_MIDDLEWARES*
- *DUPEFILTER_CLASS*
- *EXTENSIONS*
- *FEED_EXPORTERS*
- *FEED_STORAGES*
- *ITEM_PIPELINES*
- *SCHEDULER*
- *SCHEDULER_DISK_QUEUE*
- *SCHEDULER_MEMORY_QUEUE*
- *SCHEDULER_PRIORITY_QUEUE*
- *SCHEDULER_START_DISK_QUEUE*
- *SCHEDULER_START_MEMORY_QUEUE*
- *SPIDER_MIDDLEWARES*

Third-party Scrapy components may also let you define additional Scrapy components, usually configurable through *settings*, to modify their behavior.

6.9.1 Initializing from the crawler

Any Scrapy component may optionally define the following class method:

classmethod from_crawler(*cls*, *crawler:* scrapy.crawler.Crawler, **args*, ***kwargs*)

Return an instance of the component based on *crawler*.

args and *kwargs* are component-specific arguments that some components receive. However, most components do not get any arguments, and instead *use settings*.

If a component class defines this method, this class method is called to create any instance of the component.

The *crawler* object provides access to all Scrapy core components like *settings* and *signals*, allowing the component to access them and hook its functionality into Scrapy.

6.9.2 Settings

Components can be configured through *settings*.

Components can read any setting from the `settings` attribute of the `Crawler` object they can *get for initialization*. That includes both built-in and custom settings.

For example:

```
class MyExtension:
    @classmethod
    def from_crawler(cls, crawler):
        settings = crawler.settings
        return cls(settings.getbool("LOG_ENABLED"))

    def __init__(self, log_is_enabled=False):
        if log_is_enabled:
            print("log is enabled!")
```

Components do not need to declare their custom settings programmatically. However, they should document them, so that users know they exist and how to use them.

It is a good practice to prefix custom settings with the name of the component, to avoid collisions with custom settings of other existing (or future) components. For example, an extension called `WarcCaching` could prefix its custom settings with `WARC_CACHING_`.

Another good practice, mainly for components meant for *component priority dictionaries*, is to provide a boolean setting called `<PREFIX>_ENABLED` (e.g. `WARC_CACHING_ENABLED`) to allow toggling that component on and off without changing the component priority dictionary setting. You can usually check the value of such a setting during initialization, and if `False`, raise *`NotConfigured`*.

When choosing a name for a custom setting, it is also a good idea to have a look at the names of *built-in settings*, to try to maintain consistency with them.

6.9.3 Enforcing requirements

Sometimes, your components may only be intended to work under certain conditions. For example, they may require a minimum version of Scrapy to work as intended, or they may require certain settings to have specific values.

In addition to describing those conditions in the documentation of your component, it is a good practice to raise an exception from the `__init__` method of your component if those conditions are not met at run time.

In the case of *downloader middlewares*, *extensions*, *item pipelines*, and *spider middlewares*, you should raise *`NotConfigured`*, passing a description of the issue as a parameter to the exception so that it is printed in the logs, for the user to see. For other components, feel free to raise whatever other exception feels right to you; for example, `RuntimeError` would make sense for a Scrapy version mismatch, while `ValueError` may be better if the issue is the value of a setting.

If your requirement is a minimum Scrapy version, you may use `scrapy.__version__` to enforce your requirement. For example:

```
from packaging.version import parse as parse_version

import scrapy

class MyComponent:
    def __init__(self):
        if parse_version(scrapy.__version__) < parse_version("2.7"):
            raise RuntimeError(
                f"{MyComponent.__qualname__} requires Scrapy 2.7 or "
                f"later, which allow defining the process_spider_output "
                f"method of spider middlewares as an asynchronous "
                f"generator."
            )
```

6.9.4 API reference

The following function can be used to create an instance of a component class:

scrapy.utils.misc.**build_from_crawler**(*objcls: type[T]*, *crawler:* Crawler, */*, **args: Any*, ***kwargs: Any*) → T

Construct a class instance using its `from_crawler` or `from_settings` constructor.

Added in version 2.12.

`*args` and `**kwargs` are forwarded to the constructor.

Raises `TypeError` if the resulting instance is `None`.

The following function can also be useful when implementing a component, to report the import path of the component class, e.g. when reporting problems:

scrapy.utils.python.**global_object_name**(*obj: Any*) → str

Return the full import path of the given object.

```
>>> from scrapy import Request
>>> global_object_name(Request)
'scrapy.http.request.Request'
>>> global_object_name(Request.replace)
'scrapy.http.request.Request.replace'
```

6.10 Core API

This section documents the Scrapy core API, and it's intended for developers of extensions and middlewares.

6.10.1 Crawler API

The main entry point to the Scrapy API is the *Crawler* object, which *components* can *get for initialization*. It provides access to all Scrapy core components, and it is the only way for components to access them and hook their functionality into Scrapy. The Extension Manager is responsible for loading and keeping track of installed extensions and it's configured through the *EXTENSIONS* setting which contains a dictionary of all available extensions and their order similar to how you *configure the downloader middlewares*.

class scrapy.crawler.**Crawler**(*spidercls: type[*Spider*]*, *settings: dict[str, Any]* | Settings | *None* = *None*, *init_reactor: bool* = *False*)

The Crawler object must be instantiated with a *scrapy.Spider* subclass and a *scrapy.settings.Settings* object.

request_fingerprinter

The request fingerprint builder of this crawler.

This is used from extensions and middlewares to build short, unique identifiers for requests. See *Request fingerprints*.

settings

The settings manager of this crawler.

This is used by extensions & middlewares to access the Scrapy settings of this crawler.

For an introduction on Scrapy settings see *Settings*.

For the API see *Settings* class.

signals

The signals manager of this crawler.

This is used by extensions & middlewares to hook themselves into Scrapy functionality.

For an introduction on signals see *Signals*.

For the API see `SignalManager` class.

stats

The stats collector of this crawler.

This is used from extensions & middlewares to record stats of their behaviour, or access stats collected by other extensions.

For an introduction on stats collection see *Stats Collection*.

For the API see `StatsCollector` class.

extensions

The extension manager that keeps track of enabled extensions.

Most extensions won't need to access this attribute.

For an introduction on extensions and a list of available extensions on Scrapy see *Extensions*.

engine

The execution engine, which coordinates the core crawling logic between the scheduler, downloader and spiders.

Some extension may want to access the Scrapy engine, to inspect or modify the downloader and scheduler behaviour, although this is an advanced use and this API is not yet stable.

spider

Spider currently being crawled. This is an instance of the spider class provided while constructing the crawler, and it is created after the arguments given in the `crawl()` method.

crawl(**args*, ***kwargs*)

Starts the crawler by instantiating its spider class with the given `args` and `kwargs` arguments, while setting the execution engine in motion. Should be called only once.

Returns a deferred that is fired when the crawl is finished.

stop() → Generator[Deferred[Any], Any, None]

Starts a graceful stop of the crawler and returns a deferred that is fired when the crawler is stopped.

get_addon(*cls: type[_T]*) → _T | None

Return the run-time instance of an *add-on* of the specified class or a subclass, or `None` if none is found.

Added in version 2.12.

get_downloader_middleware(*cls: type[_T]*) → _T | None

Return the run-time instance of a *downloader middleware* of the specified class or a subclass, or `None` if none is found.

Added in version 2.12.

This method can only be called after the crawl engine has been created, e.g. at signals `engine_started` or `spider_opened`.

get_extension(*cls: type[_T]*) → _T | None

Return the run-time instance of an *extension* of the specified class or a subclass, or `None` if none is found.

Added in version 2.12.

This method can only be called after the extension manager has been created, e.g. at signals `engine_started` or `spider_opened`.

get_item_pipeline(*cls: type[_T]*) → _T | None

Return the run-time instance of a *item pipeline* of the specified class or a subclass, or `None` if none is found.

Added in version 2.12.

This method can only be called after the crawl engine has been created, e.g. at signals `engine_started` or `spider_opened`.

get_spider_middleware(*cls: type[_T]*) → _T | None

Return the run-time instance of a *spider middleware* of the specified class or a subclass, or `None` if none is found.

Added in version 2.12.

This method can only be called after the crawl engine has been created, e.g. at signals `engine_started` or `spider_opened`.

class scrapy.crawler.**CrawlerRunner**(*settings: dict[str, Any] | Settings | None = None*)

This is a convenient helper class that keeps track of, manages and runs crawlers inside an already setup `reactor`.

The CrawlerRunner object must be instantiated with a `Settings` object.

This class shouldn't be needed (since Scrapy is responsible of using it accordingly) unless writing scripts that manually handle the crawling process. See *Run Scrapy from a script* for an example.

crawl(*crawler_or_spidercls: type[Spider] | str | Crawler, *args: Any, **kwargs: Any*) → Deferred[None]

Run a crawler with the provided arguments.

It will call the given Crawler's `crawl()` method, while keeping track of it so it can be stopped later.

If `crawler_or_spidercls` isn't a `Crawler` instance, this method will try to create one using this parameter as the spider class given to it.

Returns a deferred that is fired when the crawling is finished.

Parameters

- **crawler_or_spidercls** (`Crawler` instance, `Spider` subclass or string) – already created crawler, or a spider class or spider's name inside the project to create it
- **args** – arguments to initialize the spider
- **kwargs** – keyword arguments to initialize the spider

property crawlers

Set of `crawlers` started by `crawl()` and managed by this class.

create_crawler(*crawler_or_spidercls: type[Spider] | str | Crawler*) → *Crawler*

Return a `Crawler` object.

- If `crawler_or_spidercls` is a Crawler, it is returned as-is.
- If `crawler_or_spidercls` is a Spider subclass, a new Crawler is constructed for it.
- If `crawler_or_spidercls` is a string, this function finds a spider with this name in a Scrapy project (using spider loader), then creates a Crawler instance for it.

join()

Returns a deferred that is fired when all managed *crawlers* have completed their executions.

stop() → Deferred[Any]

Stops simultaneously all the crawling jobs taking place.

Returns a deferred that is fired when they all have ended.

class scrapy.crawler.**CrawlerProcess**(*settings: dict[str, Any] | Settings | None = None*, *install_root_handler: bool = True*)

Bases: *CrawlerRunner*

A class to run multiple scrapy crawlers in a process simultaneously.

This class extends *CrawlerRunner* by adding support for starting a `reactor` and handling shutdown signals, like the keyboard interrupt command Ctrl-C. It also configures top-level logging.

This utility should be a better fit than *CrawlerRunner* if you aren't running another `reactor` within your application.

The CrawlerProcess object must be instantiated with a *Settings* object.

Parameters
install_root_handler – whether to install root logging handler (default: True)

This class shouldn't be needed (since Scrapy is responsible of using it accordingly) unless writing scripts that manually handle the crawling process. See *Run Scrapy from a script* for an example.

crawl(*crawler_or_spidercls: type[Spider] | str | Crawler*, **args: Any*, ***kwargs: Any*) → Deferred[None]

Run a crawler with the provided arguments.

It will call the given Crawler's *crawl()* method, while keeping track of it so it can be stopped later.

If `crawler_or_spidercls` isn't a *Crawler* instance, this method will try to create one using this parameter as the spider class given to it.

Returns a deferred that is fired when the crawling is finished.

Parameters

- **crawler_or_spidercls** (*Crawler* instance, *Spider* subclass or string) – already created crawler, or a spider class or spider's name inside the project to create it
- **args** – arguments to initialize the spider
- **kwargs** – keyword arguments to initialize the spider

property crawlers

Set of *crawlers* started by *crawl()* and managed by this class.

create_crawler(*crawler_or_spidercls: type[Spider] | str | Crawler*) → *Crawler*

Return a *Crawler* object.

- If `crawler_or_spidercls` is a Crawler, it is returned as-is.
- If `crawler_or_spidercls` is a Spider subclass, a new Crawler is constructed for it.
- If `crawler_or_spidercls` is a string, this function finds a spider with this name in a Scrapy project (using spider loader), then creates a Crawler instance for it.

join()

Returns a deferred that is fired when all managed *crawlers* have completed their executions.

start(*stop_after_crawl: bool = True*, *install_signal_handlers: bool = True*) → None

This method starts a `reactor`, adjusts its pool size to *REACTOR_THREADPOOL_MAXSIZE*, and installs a DNS cache based on *DNSCACHE_ENABLED* and *DNSCACHE_SIZE*.

If `stop_after_crawl` is True, the reactor will be stopped after all crawlers have finished, using *join()*.

Parameters

- **stop_after_crawl** (*bool*) – stop or not the reactor when all crawlers have finished
- **install_signal_handlers** (*bool*) – whether to install the OS signal handlers from Twisted and Scrapy (default: True)

stop() → Deferred[Any]

Stops simultaneously all the crawling jobs taking place.

Returns a deferred that is fired when they all have ended.

6.10.2 Settings API

scrapy.settings.**SETTINGS_PRIORITIES**

Dictionary that sets the key name and priority level of the default settings priorities used in Scrapy.

Each item defines a settings entry point, giving it a code name for identification and an integer priority. Greater priorities take more precedence over lesser ones when setting and retrieving values in the *Settings* class.

```
SETTINGS_PRIORITIES = {
    "default": 0,
    "command": 10,
    "addon": 15,
    "project": 20,
    "spider": 30,
    "cmdline": 40,
}
```

For a detailed explanation on each settings sources, see: *Settings*.

scrapy.settings.**get_settings_priority**(*priority: int | str*) → int

Small helper function that looks up a given string priority in the *SETTINGS_PRIORITIES* dictionary and returns its numerical value, or directly returns a given numerical priority.

class scrapy.settings.**Settings**(*values: _SettingsInputT = None*, *priority: int | str = 'project'*)

Bases: *BaseSettings*

This object stores Scrapy settings for the configuration of internal components, and can be used for any further customization.

It is a direct subclass and supports all methods of *BaseSettings*. Additionally, after instantiation of this class, the new object will have the global default settings described on *Built-in settings reference* already populated.

class scrapy.settings.**BaseSettings**(*values: _SettingsInputT = None*, *priority: int | str = 'project'*)

Instances of this class behave like dictionaries, but store priorities along with their `(key, value)` pairs, and can be frozen (i.e. marked immutable).

Key-value entries can be passed on initialization with the `values` argument, and they would take the `priority` level (unless `values` is already an instance of *BaseSettings*, in which case the existing priority levels will be kept). If the `priority` argument is a string, the priority name will be looked up in *SETTINGS_PRIORITIES*. Otherwise, a specific integer should be provided.

Once the object is created, new settings can be loaded or updated with the *set()* method, and can be accessed with the square bracket notation of dictionaries, or with the *get()* method of the instance and its value conversion variants. When requesting a stored key, the value with the highest priority will be retrieved.

add_to_list(*name: bool | float | int | str | None*, *item: Any*) → None

Append *item* to the `list` setting with the specified *name* if *item* is not already in that list.

This change is applied regardless of the priority of the *name* setting. The setting priority is not affected by this change either.

copy() → Self

Make a deep copy of current settings.

This method returns a new instance of the *Settings* class, populated with the same values and their priorities.

Modifications to the new object won't be reflected on the original settings.

copy_to_dict() → dict[bool | float | int | str | None, Any]

Make a copy of current settings and convert to a dict.

This method returns a new dict populated with the same values and their priorities as the current settings.

Modifications to the returned dict won't be reflected on the original settings.

This method can be useful for example for printing settings in Scrapy shell.

freeze() → None

Disable further changes to the current settings.

After calling this method, the present state of the settings will become immutable. Trying to change values through the *set()* method and its variants won't be possible and will be alerted.

frozencopy() → Self

Return an immutable copy of the current settings.

Alias for a *freeze()* call in the object returned by *copy()*.

get(*name: bool | float | int | str | None*, *default: Any = None*) → Any

Get a setting value without affecting its original type.

Parameters

- **name** (*str*) – the setting name
- **default** (*object*) – the value to return if no setting is found

getbool(*name: bool | float | int | str | None*, *default: bool = False*) → bool

Get a setting value as a boolean.

`1`, `'1'`, *True* ` and `'True'` return `True`, while `0`, `'0'`, `False`, `'False'` and `None` return `False`.

For example, settings populated through environment variables set to `'0'` will return `False` when using this method.

Parameters

- **name** (*str*) – the setting name
- **default** (*object*) – the value to return if no setting is found

getdict(*name: bool | float | int | str | None*, *default: dict[Any, Any] | None = None*) → dict[Any, Any]

Get a setting value as a dictionary. If the setting original type is a dictionary, a copy of it will be returned. If it is a string it will be evaluated as a JSON dictionary. In the case that it is a `BaseSettings` instance itself, it will be converted to a dictionary, containing all its current settings values as they would be returned by `get()`, and losing all information about priority and mutability.

Parameters

- **name** (*str*) – the setting name
- **default** (*object*) – the value to return if no setting is found

getdictorlist(*name: bool | float | int | str | None*, *default: dict[Any, Any] | list[Any] | tuple[Any] | None = None*) → dict[Any, Any] | list[Any]

Get a setting value as either a `dict` or a `list`.

If the setting is already a dict or a list, a copy of it will be returned.

If it is a string it will be evaluated as JSON, or as a comma-separated list of strings as a fallback.

For example, settings populated from the command line will return:

- `{'key1': 'value1', 'key2': 'value2'}` if set to `'{"key1": "value1", "key2": "value2"}'`
- `['one', 'two']` if set to `'["one", "two"]'` or `'one,two'`

Parameters

- **name** (*string*) – the setting name
- **default** (*any*) – the value to return if no setting is found

getfloat(*name: bool | float | int | str | None*, *default: float = 0.0*) → float

Get a setting value as a float.

Parameters

- **name** (*str*) – the setting name
- **default** (*object*) – the value to return if no setting is found

getint(*name: bool | float | int | str | None*, *default: int = 0*) → int

Get a setting value as an int.

Parameters

- **name** (*str*) – the setting name
- **default** (*object*) – the value to return if no setting is found

getlist(*name: bool | float | int | str | None*, *default: list[Any] | None = None*) → list[Any]

Get a setting value as a list. If the setting original type is a list, a copy of it will be returned. If it's a string it will be split by ",". If it is an empty string, an empty list will be returned.

For example, settings populated through environment variables set to `'one,two'` will return a list ['one', 'two'] when using this method.

Parameters

- **name** (*str*) – the setting name
- **default** (*object*) – the value to return if no setting is found

getpriority(*name: bool | float | int | str | None*) → int | None

Return the current numerical priority value of a setting, or `None` if the given `name` does not exist.

Parameters
name (*str*) – the setting name

getwithbase(*name: bool | float | int | str | None*) → *BaseSettings*

Get a composition of a dictionary-like setting and its *_BASE* counterpart.

Parameters
name (*str*) – name of the dictionary-like setting

maxpriority() → int

Return the numerical value of the highest priority present throughout all settings, or the numerical value for `default` from *SETTINGS_PRIORITIES* if there are no settings stored.

pop(*k*[, *d*]) → v, remove specified key and return the corresponding value.

If key is not found, d is returned if given, otherwise KeyError is raised.

remove_from_list(*name: bool | float | int | str | None*, *item: Any*) → None

Remove *item* from the `list` setting with the specified *name*.

If *item* is missing, raise `ValueError`.

This change is applied regardless of the priority of the *name* setting. The setting priority is not affected by this change either.

replace_in_component_priority_dict(*name: bool | float | int | str | None*, *old_cls: type*, *new_cls: type*, *priority: int | None = None*) → None

Replace *old_cls* with *new_cls* in the *name component priority dictionary*.

If *old_cls* is missing, or has `None` as value, `KeyError` is raised.

If *old_cls* was present as an import string, even more than once, those keys are dropped and replaced by *new_cls*.

If *priority* is specified, that is the value assigned to *new_cls* in the component priority dictionary. Otherwise, the value of *old_cls* is used. If *old_cls* was present multiple times (possible with import strings) with different values, the value assigned to *new_cls* is one of them, with no guarantee about which one it is.

This change is applied regardless of the priority of the *name* setting. The setting priority is not affected by this change either.

set(*name: bool | float | int | str | None*, *value: Any*, *priority: int | str = 'project'*) → None

Store a key/value attribute with a given priority.

Settings should be populated *before* configuring the Crawler object (through the `configure()` method), otherwise they won't have any effect.

Parameters

- **name** (*str*) – the setting name
- **value** (*object*) – the value to associate with the setting
- **priority** (*str or int*) – the priority of the setting. Should be a key of *SETTINGS_PRIORITIES* or an integer

set_in_component_priority_dict(*name: bool | float | int | str | None*, *cls: type*, *priority: int | None*) → None

Set the *cls* component in the *name component priority dictionary* setting with *priority*.

If *cls* already exists, its value is updated.

If *cls* was present as an import string, even more than once, those keys are dropped and replaced by *cls*.

This change is applied regardless of the priority of the *name* setting. The setting priority is not affected by this change either.

setdefault(*k*[, *d*]) → D.get(k,d), also set D[k]=d if k not in D

setdefault_in_component_priority_dict(*name: bool | float | int | str | None*, *cls: type*, *priority: int | None*) → None

Set the *cls* component in the *name component priority dictionary* setting with *priority* if not already defined (even as an import string).

If *cls* is not already defined, it is set regardless of the priority of the *name* setting. The setting priority is not affected by this change either.

setmodule(*module: ModuleType | str*, *priority: int | str = 'project'*) → None

Store settings from a module with a given priority.

This is a helper function that calls `set()` for every globally declared uppercase variable of `module` with the provided `priority`.

Parameters

- **module** (*types.ModuleType or str*) – the module or the path of the module
- **priority** (*str or int*) – the priority of the settings. Should be a key of `SETTINGS_PRIORITIES` or an integer

update(*values: _SettingsInputT*, *priority: int | str = 'project'*) → None

Store key/value pairs with a given priority.

This is a helper function that calls `set()` for every item of `values` with the provided `priority`.

If `values` is a string, it is assumed to be JSON-encoded and parsed into a dict with `json.loads()` first. If it is a `BaseSettings` instance, the per-key priorities will be used and the `priority` parameter ignored. This allows inserting/updating settings with different priorities with a single command.

Parameters

- **values** (dict or string or `BaseSettings`) – the settings names and values
- **priority** (*str or int*) – the priority of the settings. Should be a key of `SETTINGS_PRIORITIES` or an integer

6.10.3 SpiderLoader API

class scrapy.spiderloader.**SpiderLoader**

This class is in charge of retrieving and handling the spider classes defined across the project.

Custom spider loaders can be employed by specifying their path in the `SPIDER_LOADER_CLASS` project setting. They must fully implement the `scrapy.interfaces.ISpiderLoader` interface to guarantee an errorless execution.

from_settings(*settings*)

This class method is used by Scrapy to create an instance of the class. It's called with the current project settings, and it loads the spiders found recursively in the modules of the `SPIDER_MODULES` setting.

Parameters

settings (`Settings` instance) – project settings

load(*spider_name*)

Get the Spider class with the given name. It'll look into the previously loaded spiders for a spider class with name `spider_name` and will raise a KeyError if not found.

Parameters
spider_name (*str*) – spider class name

list()

Get the names of the available spiders in the project.

find_by_request(*request*)

List the spiders' names that can handle the given request. Will try to match the request's url against the domains of the spiders.

Parameters
request (*Request* instance) – queried request

6.10.4 Signals API

class scrapy.signalmanager.**SignalManager**(*sender: Any = _Anonymous*)

connect(*receiver: Any*, *signal: Any*, ***kwargs: Any*) → None

Connect a receiver function to a signal.

The signal can be any object, although Scrapy comes with some predefined signals that are documented in the *Signals* section.

Parameters

- **receiver** (*collections.abc.Callable*) – the function to be connected
- **signal** (*object*) – the signal to connect to

disconnect(*receiver: Any*, *signal: Any*, ***kwargs: Any*) → None

Disconnect a receiver function from a signal. This has the opposite effect of the *connect()* method, and the arguments are the same.

disconnect_all(*signal: Any*, ***kwargs: Any*) → None

Disconnect all receivers from the given signal.

Parameters
signal (*object*) – the signal to disconnect from

send_catch_log(*signal: Any*, ***kwargs: Any*) → list[tuple[Any, Any]]

Send a signal, catch exceptions and log them.

The keyword arguments are passed to the signal handlers (connected through the *connect()* method).

send_catch_log_deferred(*signal: Any*, ***kwargs: Any*) → Deferred[list[tuple[Any, Any]]]

Like *send_catch_log()* but supports returning `Deferred` objects from signal handlers.

Returns a Deferred that gets fired once all signal handlers deferreds were fired. Send a signal, catch exceptions and log them.

The keyword arguments are passed to the signal handlers (connected through the *connect()* method).

async wait_for(*signal*)

Await the next *signal*.

See *Delaying start request iteration* for an example.

6.10.5 Stats Collector API

There are several Stats Collectors available under the *scrapy.statscollectors* module and they all implement the Stats Collector API defined by the *StatsCollector* class (which they all inherit from).

class scrapy.statscollectors.**StatsCollector**

get_value(*key*, *default=None*)

Return the value for the given stats key or default if it doesn't exist.

get_stats()

Get all stats from the currently running spider as a dict.

set_value(*key*, *value*)

Set the given value for the given stats key.

set_stats(*stats*)

Override the current stats with the dict passed in `stats` argument.

inc_value(*key*, *count=1*, *start=0*)

Increment the value of the given stats key, by the given count, assuming the start value given (when it's not set).

max_value(*key*, *value*)

Set the given value for the given key only if current value for the same key is lower than value. If there is no current value for the given key, the value is always set.

min_value(*key*, *value*)

Set the given value for the given key only if current value for the same key is greater than value. If there is no current value for the given key, the value is always set.

clear_stats()

Clear all stats.

The following methods are not part of the stats collection api but instead used when implementing custom stats collectors:

open_spider(*spider*)

Open the given spider for stats collection.

close_spider(*spider*)

Close the given spider. After this is called, no more specific stats can be accessed or collected.

6.10.6 Engine API

class scrapy.core.engine.**ExecutionEngine**

needs_backout() → bool

Returns `True` if no more requests can be sent at the moment, or `False` otherwise.

See *Delaying start request iteration* for an example.

Architecture overview
Understand the Scrapy architecture.

Add-ons
Enable and configure third-party extensions.

Downloader Middleware
Customize how pages get requested and downloaded.

Spider Middleware
: Customize the input and output of your spiders.

Extensions
: Extend Scrapy with your custom functionality

Signals
: See all available signals and how to work with them.

Scheduler
: Understand the scheduler component.

Item Exporters
: Quickly export your scraped items to a file (XML, CSV, etc).

Components
: Learn the common API and some good practices when building custom Scrapy components.

Core API
: Use it on extensions and middlewares to extend Scrapy functionality.

CHAPTER

SEVEN

ALL THE REST

7.1 Release notes

7.1.1 Scrapy 2.13.2 (2025-06-09)

- Fixed a bug introduced in Scrapy 2.13.0 that caused results of request errbacks to be ignored when the errback was called because of a downloader error. (issue 6861, issue 6863)
- Added a note about the behavior change of *scrapy.utils.reactor.is_asyncio_reactor_installed()* to its docs and to the "Backward-incompatible changes" section of *the Scrapy 2.13.0 release notes*. (issue 6866)
- Improved the message in the exception raised by `scrapy.utils.test.get_reactor_settings()` when there is no reactor installed. (issue 6866)
- Updated the *scrapy.crawler.CrawlerRunner* examples in *Common Practices* to install the reactor explicitly, to fix reactor-related errors with Scrapy 2.13.0 and later. (issue 6865)
- Fixed `scrapy fetch` not working with scrapy-poet. (issue 6872)
- Fixed an exception produced by *scrapy.core.engine.ExecutionEngine* when it's closed before being fully initialized. (issue 6857, issue 6867)
- Improved the README, updated the Scrapy logo in it. (issue 6831, issue 6833, issue 6839)
- Restricted the Twisted version used in tests to below 25.5.0, as some tests fail with 25.5.0. (issue 6878, issue 6882)
- Updated type hints for Twisted 25.5.0 changes. (issue 6882)
- Removed the old artwork. (issue 6874)

7.1.2 Scrapy 2.13.1 (2025-05-28)

- Give callback requests precedence over start requests when priority values are the same.

  This makes changes from 2.13.0 to start request handling more intuitive and backward compatible. For scenarios where all requests have the same priorities, in 2.13.0 all start requests were sent before the first callback request. In 2.13.1, same as in 2.12 and lower, start requests are only sent when there are not enough pending callback requests to reach concurrency limits.

  (issue 6828)
- Added a deepwiki badge to the README. (issue 6793)
- Fixed a typo in the code example of *Delaying start request iteration*. (issue 6812, issue 6815)
- Fixed a typo in the *Supported callables* section of the documentation. (issue 6822)
- Made this page more prominently listed in PyPI project links. (issue 6826)

7.1.3 Scrapy 2.13.0 (2025-05-08)

Highlights:

- The asyncio reactor is now enabled by default
- Replaced `start_requests()` (sync) with *`start()`* (async) and changed how it is iterated.
- Added the *`allow_offsite`* request meta key
- *Spider middlewares that don't support asynchronous spider output* are deprecated
- Added a base class for *universal spider middlewares*

Modified requirements

- Dropped support for PyPy 3.9. (issue 6613)
- Added support for PyPy 3.11. (issue 6697)

Backward-incompatible changes

- The default value of the *`TWISTED_REACTOR`* setting was changed from `None` to `"twisted.internet.asyncioreactor.AsyncioSelectorReactor"`. This value was used in newly generated projects since Scrapy 2.7.0 but now existing projects that don't explicitly set this setting will also use the asyncio reactor. You can *change this setting in your project* to use a different reactor. (issue 6659, issue 6713)
- The iteration of start requests and items no longer stops once there are requests in the scheduler, and instead runs continuously until all start requests have been scheduled.

  To reproduce the previous behavior, see *Delaying start request iteration*. (issue 6729)
- An unhandled exception from the `open_spider()` method of a *spider middleware* no longer stops the crawl. (issue 6729)
- In `scrapy.core.engine.ExecutionEngine`:
  - The second parameter of `open_spider()`, `start_requests`, has been removed. The start requests are determined by the `spider` parameter instead (see *`start()`*).
  - The `slot` attribute has been renamed to `_slot` and should not be used.

  (issue 6729)
- In `scrapy.core.engine`, the `Slot` class has been renamed to `_Slot` and should not be used. (issue 6729)
- The `slot` *telnet variable* has been removed. (issue 6729)
- In `scrapy.core.spidermw.SpiderMiddlewareManager`, `process_start_requests()` has been replaced by `process_start()`. (issue 6729)
- The now-deprecated `start_requests()` method, when it returns an iterable instead of being defined as a generator, is now executed *after* the *scheduler* instance has been created. (issue 6729)
- When using *`JOBDIR`*, *start requests* are now serialized into their own, `s`-suffixed priority folders. You can set *`SCHEDULER_START_DISK_QUEUE`* to `None` or `""` to change that, but the side effects may be undesirable. See *`SCHEDULER_START_DISK_QUEUE`* for details. (issue 6729)
- The URL length limit, set by the *`URLLENGTH_LIMIT`* setting, is now also enforced for start requests. (issue 6777)
- Calling *`scrapy.utils.reactor.is_asyncio_reactor_installed()`* without an installed reactor now raises an exception instead of installing a reactor. This shouldn't affect normal Scrapy use cases, but it may affect 3rd-party test suites that use Scrapy internals such as *`Crawler`* and don't install a reactor explicitly. If you are affected by this change, you most likely need to install the reactor before running Scrapy code that expects it to be installed. (issue 6732, issue 6735)

- The `from_settings()` method of *`UrlLengthMiddleware`*, deprecated in Scrapy 2.12.0, is removed earlier than the usual deprecation period (this was needed because after the introduction of the *`BaseSpiderMiddleware`* base class and switching built-in spider middlewares to it those middlewares need the *`Crawler`* instance at run time). Please use `from_crawler()` instead. (issue 6693)
- `scrapy.utils.url.escape_ajax()` is no longer called when a *`Request`* instance is created. It was only useful for websites supporting the `_escaped_fragment_` feature which most modern websites don't support. If you still need this you can modify the URLs before passing them to *`Request`*. (issue 6523, issue 6651)

Deprecation removals

- Removed old deprecated name aliases for some signals:
  - `stats_spider_opened` (use `spider_opened` instead)
  - `stats_spider_closing` and `stats_spider_closed` (use `spider_closed` instead)
  - `item_passed` (use `item_scraped` instead)
  - `request_received` (use `request_scheduled` instead)

  (issue 6654, issue 6655)

Deprecations

- The `start_requests()` method of *`Spider`* is deprecated, use *`start()`* instead, or both to maintain support for lower Scrapy versions. (issue 456, issue 3477, issue 4467, issue 5627, issue 6729)
- The `process_start_requests()` method of *spider middlewares* is deprecated, use *`process_start()`* instead, or both to maintain support for lower Scrapy versions. (issue 456, issue 3477, issue 4467, issue 5627, issue 6729)
- The `__init__` method of priority queue classes (see *`SCHEDULER_PRIORITY_QUEUE`*) should now support a keyword-only `start_queue_cls` parameter. (issue 6752)
- *Spider middlewares that don't support asynchronous spider output* are deprecated. The async iterable downgrading feature, needed for using such middlewares with asynchronous callbacks and with other spider middlewares that produce asynchronous iterables, is also deprecated. Please update all such middlewares to support asynchronous spider output. (issue 6664)
- Functions that were imported from `w3lib.url` and re-exported in `scrapy.utils.url` are now deprecated, you should import them from `w3lib.url` directly. They are:
  - `scrapy.utils.url.add_or_replace_parameter()`
  - `scrapy.utils.url.add_or_replace_parameters()`
  - `scrapy.utils.url.any_to_uri()`
  - `scrapy.utils.url.canonicalize_url()`
  - `scrapy.utils.url.file_uri_to_path()`
  - `scrapy.utils.url.is_url()`
  - `scrapy.utils.url.parse_data_uri()`
  - `scrapy.utils.url.parse_url()`
  - `scrapy.utils.url.path_to_file_uri()`
  - `scrapy.utils.url.safe_download_url()`
  - `scrapy.utils.url.safe_url_string()`
  - `scrapy.utils.url.url_query_cleaner()`

  - `scrapy.utils.url.url_query_parameter()`

  (issue 4577, issue 6583, issue 6586)

- HTTP/1.0 support code is deprecated. It was disabled by default and couldn't be used together with HTTP/1.1. If you still need it, you should write your own download handler or copy the code from Scrapy. The deprecations include:
  - `scrapy.core.downloader.handlers.http10.HTTP10DownloadHandler`
  - `scrapy.core.downloader.webclient.ScrapyHTTPClientFactory`
  - `scrapy.core.downloader.webclient.ScrapyHTTPPageGetter`
  - Overriding `scrapy.core.downloader.contextfactory.ScrapyClientContextFactory.getContext()`

  (issue 6634)

- The following modules and functions used only in tests are deprecated:
  - the `scrapy/utils/testproc` module
  - the `scrapy/utils/testsite` module
  - `scrapy.utils.test.assert_gcs_environ()`
  - `scrapy.utils.test.get_ftp_content_and_delete()`
  - `scrapy.utils.test.get_gcs_content_and_delete()`
  - `scrapy.utils.test.mock_google_cloud_storage()`
  - `scrapy.utils.test.skip_if_no_boto()`

  If you need to use them in your tests or code, you can copy the code from Scrapy. (issue 6696)

- `scrapy.utils.test.TestSpider` is deprecated. If you need an empty spider class you can use `scrapy.utils.spider.DefaultSpider` or create your own subclass of *scrapy.Spider*. (issue 6678)
- `scrapy.downloadermiddlewares.ajaxcrawl.AjaxCrawlMiddleware` is deprecated. It was disabled by default and isn't useful for most of the existing websites. (issue 6523, issue 6651, issue 6656)
- `scrapy.utils.url.escape_ajax()` is deprecated. (issue 6523, issue 6651)
- `scrapy.spiders.init.InitSpider` is deprecated. If you find it useful, you can copy its code from Scrapy. (issue 6708, issue 6714)
- `scrapy.utils.versions.scrapy_components_versions()` is deprecated, use `scrapy.utils.versions.get_versions()` instead. (issue 6582)
- `BaseDupeFilter.log()` is deprecated. It does nothing and shouldn't be called. (issue 4151)
- Passing the `spider` argument to the following methods of `Scraper` is deprecated:
  - `close_spider()`
  - `enqueue_scrape()`
  - `handle_spider_error()`
  - `handle_spider_output()`

  (issue 6764)

New features

- You can now yield the start requests and items of a spider from the *start()* spider method and from the *process_start()* spider middleware method, both asynchronous generators.

  This makes it possible to use asynchronous code to generate those start requests and items, e.g. reading them from a queue service or database using an asynchronous client, without workarounds. (issue 456, issue 3477, issue 4467, issue 5627, issue 6729)

- Start requests are now *scheduled* as soon as possible.

  As a result, their *priority* is now taken into account as soon as *CONCURRENT_REQUESTS* is reached. (issue 456, issue 3477, issue 4467, issue 5627, issue 6729)

- *Crawler.signals* has a new *wait_for()* method. (issue 6729)

- Added a new *scheduler_empty* signal. (issue 6729)

- Added new settings: *SCHEDULER_START_DISK_QUEUE* and *SCHEDULER_START_MEMORY_QUEUE*. (issue 6729)

- Added *StartSpiderMiddleware*, which sets *is_start_request* to `True` on *start requests*. (issue 6729)

- Exposed a new method of *Crawler.engine*: *needs_backout()*. (issue 6729)

- Added the *allow_offsite* request meta key that can be used instead of the more general *dont_filter* request attribute to skip processing of the request by *OffsiteMiddleware* (but not by other code that checks *dont_filter*). (issue 3690, issue 6151, issue 6366)

- Added an optional base class for spider middlewares, *BaseSpiderMiddleware*, which can be helpful for writing *universal spider middlewares* without boilerplate and code duplication. The built-in spider middlewares now inherit from this class. (issue 6693, issue 6777)

- *Scrapy add-ons* can now define a class method called `update_pre_crawler_settings()` to update *pre-crawler settings*. (issue 6544, issue 6568)

- Added *helpers* for modifying *component priority dictionary* settings. (issue 6614)

- Responses that use an unknown/unsupported encoding now produce a warning. If Scrapy knows that installing an additional package (such as brotli) will allow decoding the response, that will be mentioned in the warning. (issue 4697, issue 6618)

- Added the `spider_exceptions/count` stat which tracks the total count of exceptions (tracked also by per-type `spider_exceptions/*` stats). (issue 6739, issue 6740)

- Added the *DEFAULT_DROPITEM_LOG_LEVEL* setting and the `scrapy.exceptions.DropItem.log_level` attribute that allow customizing the log level of the message that is logged when an item is dropped. (issue 6603, issue 6608)

- Added support for the `-b, --cookie` curl argument to *scrapy.Request.from_curl()*. (issue 6684)

- Added the *LOG_VERSIONS* setting that allows customizing the list of software whose versions are logged when the spider starts. (issue 6582)

- Added the *WARN_ON_GENERATOR_RETURN_VALUE* setting that allows disabling run time analysis of callback code used to warn about incorrect `return` statements in generator-based callbacks. You may need to disable this setting if this analysis breaks on your callback code. (issue 6731, issue 6738)

Improvements

- Removed or postponed some calls of `itemadapter.is_item()` to increase performance. (issue 6719)

- Improved the error message when running a `scrapy` command that requires a project (such as `scrapy crawl`) outside of a project directory. (issue 2349, issue 3426)

- Added an empty *ADDONS* setting to the `settings.py` template for new projects. (issue 6587)

Bug fixes

- Yielding an item from *Spider.start* or from *SpiderMiddleware.process_start* no longer delays the next iteration of starting requests and items by up to 5 seconds. (issue 6729)
- Fixed calculation of `items_per_minute` and `responses_per_minute` stats. (issue 6599)
- Fixed an error initializing `scrapy.extensions.feedexport.GCSFeedStorage`. (issue 6617, issue 6628)
- Fixed an error running `scrapy bench`. (issue 6632, issue 6633)
- Fixed duplicated log messages about the reactor and the event loop. (issue 6636, issue 6657)
- Fixed resolving type annotations of `SitemapSpider._parse_sitemap()` at run time, required by tools such as scrapy-poet. (issue 6665, issue 6671)
- Calling *scrapy.utils.reactor.is_asyncio_reactor_installed()* without an installed reactor now raises an exception instead of installing a reactor. (issue 6732, issue 6735)
- Restored support for the `x-gzip` content encoding. (issue 6618)

Documentation

- Documented the setting values set in the default project template. (issue 6762, issue 6775)
- Improved the *docs* about asynchronous iterable support in spider middlewares. (issue 6688)
- Improved the *docs* about using `Deferred`-based APIs in coroutine-based code and included a list of such APIs. (issue 6677, issue 6734, issue 6776)
- Improved the *contribution docs*. (issue 6561, issue 6575)
- Removed the `Splash` recommendation from the *headless browser* suggestion. We no longer recommend using `Splash` and recommend using other headless browser solutions instead. (issue 6642, issue 6701)
- Added the dark mode to the HTML documentation. (issue 6653)
- Other documentation improvements and fixes. (issue 4151, issue 6526, issue 6620, issue 6621, issue 6622, issue 6623, issue 6624, issue 6721, issue 6723, issue 6780)

Packaging

- Switched from `setup.py` to `pyproject.toml`. (issue 6514, issue 6547)
- Switched the build backend from setuptools to hatchling. (issue 6771)

Quality assurance

- Replaced most linters with ruff. (issue 6565, issue 6576, issue 6577, issue 6581, issue 6584, issue 6595, issue 6601, issue 6631)
- Improved accuracy and performance of collecting test coverage. (issue 6255, issue 6610)
- Fixed an error that prevented running tests from directories other than the top level source directory. (issue 6567)
- Reduced the amount of `mockserver` calls in tests to improve the overall test run time. (issue 6637, issue 6648)
- Fixed tests that were running the same test code more than once. (issue 6646, issue 6647, issue 6650)
- Refactored tests to use more `pytest` features instead of `unittest` ones where possible. (issue 6678, issue 6680, issue 6695, issue 6699, issue 6700, issue 6702, issue 6709, issue 6710, issue 6711, issue 6712, issue 6725)
- Type hints improvements and fixes. (issue 6578, issue 6579, issue 6593, issue 6605, issue 6694)

- CI and test improvements and fixes. (issue 5360, issue 6271, issue 6547, issue 6560, issue 6602, issue 6607, issue 6609, issue 6613, issue 6619, issue 6626, issue 6679, issue 6703, issue 6704, issue 6716, issue 6720, issue 6722, issue 6724, issue 6741, issue 6743, issue 6766, issue 6770, issue 6772, issue 6773)
- Code cleanups. (issue 6600, issue 6606, issue 6635, issue 6764)

7.1.4 Scrapy 2.12.0 (2024-11-18)

Highlights:

- Dropped support for Python 3.8, added support for Python 3.13
- `scrapy.Spider.start_requests()` can now yield items
- Added *JsonResponse*
- Added *CLOSESPIDER_PAGECOUNT_NO_ITEM*

Modified requirements

- Dropped support for Python 3.8. (issue 6466, issue 6472)
- Added support for Python 3.13. (issue 6166)
- Minimum versions increased for these dependencies:
  - Twisted: 18.9.0 → 21.7.0
  - cryptography: 36.0.0 → 37.0.0
  - pyOpenSSL: 21.0.0 → 22.0.0
  - lxml: 4.4.1 → 4.6.0
- Removed `setuptools` from the dependency list. (issue 6487)

Backward-incompatible changes

- User-defined cookies for HTTPS requests will have the `secure` flag set to `True` unless it's set to `False` explictly. This is important when these cookies are reused in HTTP requests, e.g. after a redirect to an HTTP URL. (issue 6357)
- The Reppy-based `robots.txt` parser, `scrapy.robotstxt.ReppyRobotParser`, was removed, as it doesn't support Python 3.9+. (issue 5230, issue 6099, issue 6499)
- The initialization API of `scrapy.pipelines.media.MediaPipeline` and its subclasses was improved and it's possible that some previously working usage scenarios will no longer work. It can only affect you if you define custom subclasses of `MediaPipeline` or create instances of these pipelines via `from_settings()` or `__init__()` calls instead of `from_crawler()` calls.

  Previously, `MediaPipeline.from_crawler()` called the `from_settings()` method if it existed or the `__init__()` method otherwise, and then did some additional initialization using the `crawler` instance. If the `from_settings()` method existed (like in `FilesPipeline`) it called `__init__()` to create the instance. It wasn't possible to override `from_crawler()` without calling `MediaPipeline.from_crawler()` from it which, in turn, couldn't be called in some cases (including subclasses of `FilesPipeline`).

  Now, in line with the general usage of `from_crawler()` and `from_settings()` and the deprecation of the latter the recommended initialization order is the following one:

  - All `__init__()` methods should take a `crawler` argument. If they also take a `settings` argument they should ignore it, using `crawler.settings` instead. When they call `__init__()` of the base class they should pass the `crawler` argument to it too.

  - A `from_settings()` method shouldn't be defined. Class-specific initialization code should go into either an overriden `from_crawler()` method or into `__init__()`.
  - It's now possible to override `from_crawler()` and it's not necessary to call `MediaPipeline.from_crawler()` in it if other recommendations were followed.
  - If pipeline instances were created with `from_settings()` or `__init__()` calls (which wasn't supported even before, as it missed important initialization code), they should now be created with `from_crawler()` calls.

  (issue 6540)

- The `response_body` argument of `ImagesPipeline.convert_image` is now positional-only, as it was changed from optional to required. (issue 6500)
- The `convert` argument of `scrapy.utils.conf.build_component_list()` is now positional-only, as the preceding argument (`custom`) was removed. (issue 6500)
- The `overwrite_output` argument of `scrapy.utils.conf.feed_process_params_from_cli()` is now positional-only, as the preceding argument (`output_format`) was removed. (issue 6500)

Deprecation removals

- Removed the `scrapy.utils.request.request_fingerprint()` function, deprecated in Scrapy 2.7.0. (issue 6212, issue 6213)
- Removed support for value `"2.6"` of setting `REQUEST_FINGERPRINTER_IMPLEMENTATION`, deprecated in Scrapy 2.7.0. (issue 6212, issue 6213)
- *`RFPDupeFilter`* subclasses now require supporting the `fingerprinter` parameter in their `__init__` method, introduced in Scrapy 2.7.0. (issue 6102, issue 6113)
- Removed the `scrapy.downloadermiddlewares.decompression` module, deprecated in Scrapy 2.7.0. (issue 6100, issue 6113)
- Removed the `scrapy.utils.response.response_httprepr()` function, deprecated in Scrapy 2.6.0. (issue 6111, issue 6116)
- Spiders with spider-level HTTP authentication, i.e. with the `http_user` or `http_pass` attributes, must now define `http_auth_domain` as well, which was introduced in Scrapy 2.5.1. (issue 6103, issue 6113)
- *Media pipelines* methods `file_path()`, `file_downloaded()`, `get_images()`, `image_downloaded()`, `media_downloaded()`, `media_to_download()`, and `thumb_path()` must now support an `item` parameter, added in Scrapy 2.4.0. (issue 6107, issue 6113)
- The `__init__()` and `from_crawler()` methods of *feed storage backend classes* must now support the keyword-only `feed_options` parameter, introduced in Scrapy 2.4.0. (issue 6105, issue 6113)
- Removed the `scrapy.loader.common` and `scrapy.loader.processors` modules, deprecated in Scrapy 2.3.0. (issue 6106, issue 6113)
- Removed the `scrapy.utils.misc.extract_regex()` function, deprecated in Scrapy 2.3.0. (issue 6106, issue 6113)
- Removed the `scrapy.http.JSONRequest` class, replaced with `JsonRequest` in Scrapy 1.8.0. (issue 6110, issue 6113)
- `scrapy.utils.log.logformatter_adapter` no longer supports missing `args`, `level`, or `msg` parameters, and no longer supports a `format` parameter, all scenarios that were deprecated in Scrapy 1.0.0. (issue 6109, issue 6116)

- A custom class assigned to the *SPIDER_LOADER_CLASS* setting that does not implement the `ISpiderLoader` interface will now raise a `zope.interface.verify.DoesNotImplement` exception at run time. Non-compliant classes have been triggering a deprecation warning since Scrapy 1.0.0. (issue 6101, issue 6113)
- Removed the `--output-format/-t` command line option, deprecated in Scrapy 2.1.0. `-O <URI>:<FORMAT>` should be used instead. (issue 6500)
- Running *crawl()* more than once on the same *Crawler* instance, deprecated in Scrapy 2.11.0, now raises an exception. (issue 6500)
- Subclassing *HttpCompressionMiddleware* without support for the `crawler` argument in `__init__()` and without a custom `from_crawler()` method, deprecated in Scrapy 2.5.0, is no longer allowed. (issue 6500)
- Removed the `EXCEPTIONS_TO_RETRY` attribute of *RetryMiddleware*, deprecated in Scrapy 2.10.0. (issue 6500)
- Removed support for *S3 feed exports* without the boto3 package installed, deprecated in Scrapy 2.10.0. (issue 6500)
- Removed the `scrapy.extensions.feedexport._FeedSlot` class, deprecated in Scrapy 2.10.0. (issue 6500)
- Removed the `scrapy.pipelines.images.NoimagesDrop` exception, deprecated in Scrapy 2.8.0. (issue 6500)
- The `response_body` argument of `ImagesPipeline.convert_image` is now required, not passing it was deprecated in Scrapy 2.8.0. (issue 6500)
- Removed the `custom` argument of `scrapy.utils.conf.build_component_list()`, deprecated in Scrapy 2.10.0. (issue 6500)
- Removed the `scrapy.utils.reactor.get_asyncio_event_loop_policy()` function, deprecated in Scrapy 2.9.0. Use `asyncio.get_event_loop()` and related standard library functions instead. (issue 6500)

Deprecations

- The `from_settings()` methods of the *Scrapy components* that have them are now deprecated. `from_crawler()` should now be used instead. Affected components:
  - *scrapy.dupefilters.RFPDupeFilter*
  - *scrapy.mail.MailSender*
  - `scrapy.middleware.MiddlewareManager`
  - `scrapy.core.downloader.contextfactory.ScrapyClientContextFactory`
  - *scrapy.pipelines.files.FilesPipeline*
  - *scrapy.pipelines.images.ImagesPipeline*
  - *scrapy.spidermiddlewares.urllength.UrlLengthMiddleware*

  (issue 6540)
- It's now deprecated to have a `from_settings()` method but no `from_crawler()` method in 3rd-party *Scrapy components*. You can define a simple `from_crawler()` method that calls `cls.from_settings(crawler.settings)` to fix this if you don't want to refactor the code. Note that if you have a `from_crawler()` method Scrapy will not call the `from_settings()` method so the latter can be removed. (issue 6540)
- The initialization API of `scrapy.pipelines.media.MediaPipeline` and its subclasses was improved and some old usage scenarios are now deprecated (see also the "Backward-incompatible changes" section). Specifically:
  - It's deprecated to define an `__init__()` method that doesn't take a `crawler` argument.

  - It's deprecated to call an `__init__()` method without passing a `crawler` argument. If it's passed, it's also deprecated to pass a `settings` argument, which will be ignored anyway.
  - Calling `from_settings()` is deprecated, use `from_crawler()` instead.
  - Overriding `from_settings()` is deprecated, override `from_crawler()` instead.

  (issue 6540)

- The `REQUEST_FINGERPRINTER_IMPLEMENTATION` setting is now deprecated. (issue 6212, issue 6213)
- The `scrapy.utils.misc.create_instance()` function is now deprecated, use *`scrapy.utils.misc.build_from_crawler()`* instead. (issue 5523, issue 5884, issue 6162, issue 6169, issue 6540)
- `scrapy.core.downloader.Downloader._get_slot_key()` is deprecated, use `scrapy.core.downloader.Downloader.get_slot_key()` instead. (issue 6340, issue 6352)
- `scrapy.utils.defer.process_chain_both()` is now deprecated. (issue 6397)
- `scrapy.twisted_version` is now deprecated, you should instead use `twisted.version` directly (but note that it's an `incremental.Version` object, not a tuple). (issue 6509, issue 6512)
- `scrapy.utils.python.flatten()` and `scrapy.utils.python.iflatten()` are now deprecated. (issue 6517, issue 6519)
- `scrapy.utils.python.equal_attributes()` is now deprecated. (issue 6517, issue 6519)
- `scrapy.utils.request.request_authenticate()` is now deprecated, you should instead just set the `Authorization` header directly. (issue 6517, issue 6519)
- `scrapy.utils.serialize.ScrapyJSONDecoder` is now deprecated, it didn't contain any code since Scrapy 1.0.0. (issue 6517, issue 6519)
- `scrapy.utils.test.assert_samelines()` is now deprecated. (issue 6517, issue 6519)
- `scrapy.extensions.feedexport.build_storage()` is now deprecated. You can instead call the builder callable directly. (issue 6540)

New features

- `scrapy.Spider.start_requests()` can now yield items. (issue 5289, issue 6417)

  Note

  Some spider middlewares may need to be updated for Scrapy 2.12 support before you can use them in combination with the ability to yield items from `start_requests()`.

- Added a new *`Response`* subclass, *`JsonResponse`*, for responses with a JSON MIME type. (issue 6069, issue 6171, issue 6174)
- The *`LogStats`* extension now adds `items_per_minute` and `responses_per_minute` to the *stats* when the spider closes. (issue 4110, issue 4111)
- Added *`CLOSESPIDER_PAGECOUNT_NO_ITEM`* which allows closing the spider if no items were scraped in a set amount of time. (issue 6434)
- User-defined cookies can now include the `secure` field. (issue 6357)
- Added component getters to *`Crawler`*: *`get_addon()`*, *`get_downloader_middleware()`*, *`get_extension()`*, *`get_item_pipeline()`*, *`get_spider_middleware()`*. (issue 6181)
- Slot delay updates by the *AutoThrottle extension* based on response latencies can now be disabled for specific requests via the *`autothrottle_dont_adjust_delay`* meta key. (issue 6246, issue 6527)

- If *SPIDER_LOADER_WARN_ONLY* is set to `True`, *SpiderLoader* does not raise `SyntaxError` but emits a warning instead. (issue 6483, issue 6484)
- Added support for multiple-compressed responses (ones with several encodings in the `Content-Encoding` header). (issue 5143, issue 5964, issue 6063)
- Added support for multiple standard values in *REFERRER_POLICY*. (issue 6381)
- Added support for brotlicffi (previously named brotlipy). brotli is still recommended but only brotlicffi works on PyPy. (issue 6263, issue 6269)
- Added *MetadataContract* that sets the request meta. (issue 6468, issue 6469)

Improvements

- Extended the list of file extensions that *LinkExtractor* ignores by default. (issue 6074, issue 6125)
- `scrapy.utils.httpobj.urlparse_cached()` is now used in more places instead of `urllib.parse.urlparse()`. (issue 6228, issue 6229)

Bug fixes

- `MediaPipeline` is now an abstract class and its methods that were expected to be overridden in subclasses are now abstract methods. (issue 6365, issue 6368)
- Fixed handling of invalid `@`-prefixed lines in contract extraction. (issue 6383, issue 6388)
- Importing `scrapy.extensions.telnet` no longer installs the default reactor. (issue 6432)
- Reduced log verbosity for dropped requests that was increased in 2.11.2. (issue 6433, issue 6475)

Documentation

- Added `SECURITY.md` that documents the security policy. (issue 5364, issue 6051)
- Example code for *running Scrapy from a script* no longer imports `twisted.internet.reactor` at the top level, which caused problems with non-default reactors when this code was used unmodified. (issue 6361, issue 6374)
- Documented the *SpiderState* extension. (issue 6278, issue 6522)
- Other documentation improvements and fixes. (issue 5920, issue 6094, issue 6177, issue 6200, issue 6207, issue 6216, issue 6223, issue 6317, issue 6328, issue 6389, issue 6394, issue 6402, issue 6411, issue 6427, issue 6429, issue 6440, issue 6448, issue 6449, issue 6462, issue 6497, issue 6506, issue 6507, issue 6524)

Quality assurance

- Added `py.typed`, in line with PEP 561. (issue 6058, issue 6059)
- Fully covered the code with type hints (except for the most complicated parts, mostly related to `twisted.web.http` and other Twisted parts without type hints). (issue 5989, issue 6097, issue 6127, issue 6129, issue 6130, issue 6133, issue 6143, issue 6191, issue 6268, issue 6274, issue 6275, issue 6276, issue 6279, issue 6325, issue 6326, issue 6333, issue 6335, issue 6336, issue 6337, issue 6341, issue 6353, issue 6356, issue 6370, issue 6371, issue 6384, issue 6385, issue 6387, issue 6391, issue 6395, issue 6414, issue 6422, issue 6460, issue 6466, issue 6472, issue 6494, issue 6498, issue 6516)
- Improved Bandit checks. (issue 6260, issue 6264, issue 6265)
- Added pyupgrade to the `pre-commit` configuration. (issue 6392)
- Added `flake8-bugbear`, `flake8-comprehensions`, `flake8-debugger`, `flake8-docstrings`, `flake8-string-format` and `flake8-type-checking` to the `pre-commit` configuration. (issue 6406, issue 6413)

- CI and test improvements and fixes. (issue 5285, issue 5454, issue 5997, issue 6078, issue 6084, issue 6087, issue 6132, issue 6153, issue 6154, issue 6201, issue 6231, issue 6232, issue 6235, issue 6236, issue 6242, issue 6245, issue 6253, issue 6258, issue 6259, issue 6270, issue 6272, issue 6286, issue 6290, issue 6296 issue 6367, issue 6372, issue 6403, issue 6416, issue 6435, issue 6489, issue 6501, issue 6504, issue 6511, issue 6543, issue 6545)
- Code cleanups. (issue 6196, issue 6197, issue 6198, issue 6199, issue 6254, issue 6257, issue 6285, issue 6305, issue 6343, issue 6349, issue 6386, issue 6415, issue 6463, issue 6470, issue 6499, issue 6505, issue 6510, issue 6531, issue 6542)

Other

- Issue tracker improvements. (issue 6066)

7.1.5 Scrapy 2.11.2 (2024-05-14)

Security bug fixes

- Redirects to non-HTTP protocols are no longer followed. Please, see the 23j4-mw76-5v7h security advisory for more information. (issue 457)
- The `Authorization` header is now dropped on redirects to a different scheme (`http://` or `https://`) or port, even if the domain is the same. Please, see the 4qqq-9vqf-3h3f security advisory for more information.
- When using system proxy settings that are different for `http://` and `https://`, redirects to a different URL scheme will now also trigger the corresponding change in proxy settings for the redirected request. Please, see the jm3v-qxmh-hxwv security advisory for more information. (issue 767)
- *`Spider.allowed_domains`* is now enforced for all requests, and not only requests from spider callbacks. (issue 1042, issue 2241, issue 6358)
- *`xmliter_lxml()`* no longer resolves XML entities. (issue 6265)
- defusedxml is now used to make `scrapy.http.request.rpc.XmlRpcRequest` more secure. (issue 6250, issue 6251)

Bug fixes

- Restored support for brotlipy, which had been dropped in Scrapy 2.11.1 in favor of brotli. (issue 6261)

> **Note**
>
> brotlipy is deprecated, both in Scrapy and upstream. Use brotli instead if you can.

- Make *`METAREFRESH_IGNORE_TAGS`* `["noscript"]` by default. This prevents *`MetaRefreshMiddleware`* from following redirects that would not be followed by web browsers with JavaScript enabled. (issue 6342, issue 6347)
- During *feed export*, do not close the underlying file from *built-in post-processing plugins*. (issue 5932, issue 6178, issue 6239)
- *`LinkExtractor`* now properly applies the `unique` and `canonicalize` parameters. (issue 3273, issue 6221)
- Do not initialize the scheduler disk queue if *`JOBDIR`* is an empty string. (issue 6121, issue 6124)
- Fix *`Spider.logger`* not logging custom extra information. (issue 6323, issue 6324)
- `robots.txt` files with a non-UTF-8 encoding no longer prevent parsing the UTF-8-compatible (e.g. ASCII) parts of the document. (issue 6292, issue 6298)

- `scrapy.http.cookies.WrappedRequest.get_header()` no longer raises an exception if `default` is `None`. (issue 6308, issue 6310)
- *`Selector`* now uses `scrapy.utils.response.get_base_url()` to determine the base URL of a given *`Response`*. (issue 6265)
- The `media_to_download()` method of *media pipelines* now logs exceptions before stripping them. (issue 5067, issue 5068)
- When passing a callback to the *`parse`* command, build the callback callable with the right signature. (issue 6182)

Documentation

- Add a FAQ entry about *creating blank requests*. (issue 6203, issue 6208)
- Document that `scrapy.Selector.type` can be `"json"`. (issue 6328, issue 6334)

Quality assurance

- Make builds reproducible. (issue 5019, issue 6322)
- Packaging and test fixes. (issue 6286, issue 6290, issue 6312, issue 6316, issue 6344)

7.1.6 Scrapy 2.11.1 (2024-02-14)

Highlights:

- Security bug fixes.
- Support for Twisted >= 23.8.0.
- Documentation improvements.

Security bug fixes

- Addressed ReDoS vulnerabilities:
  - `scrapy.utils.iterators.xmliter` is now deprecated in favor of *`xmliter_lxml()`*, which *`XMLFeedSpider`* now uses.

    To minimize the impact of this change on existing code, *`xmliter_lxml()`* now supports indicating the node namespace with a prefix in the node name, and big files with highly nested trees when using libxml2 2.7+.
  - Fixed regular expressions in the implementation of the *`open_in_browser()`* function.

  Please, see the cc65-xxvf-f7r9 security advisory for more information.
- *`DOWNLOAD_MAXSIZE`* and *`DOWNLOAD_WARNSIZE`* now also apply to the decompressed response body. Please, see the 7j7m-v7m3-jqm7 security advisory for more information.
- Also in relation with the 7j7m-v7m3-jqm7 security advisory, the deprecated `scrapy.downloadermiddlewares.decompression` module has been removed.
- The `Authorization` header is now dropped on redirects to a different domain. Please, see the cw9j-q3vf-hrrv security advisory for more information.

Modified requirements

- The Twisted dependency is no longer restricted to < 23.8.0. (issue 6024, issue 6064, issue 6142)

Bug fixes

- The OS signal handling code was refactored to no longer use private Twisted functions. (issue 6024, issue 6064, issue 6112)

Documentation

- Improved documentation for `Crawler` initialization changes made in the 2.11.0 release. (issue 6057, issue 6147)
- Extended documentation for `Request.meta`. (issue 5565)
- Fixed the `dont_merge_cookies` documentation. (issue 5936, issue 6077)
- Added a link to Zyte's export guides to the *feed exports* documentation. (issue 6183)
- Added a missing note about backward-incompatible changes in `PythonItemExporter` to the 2.11.0 release notes. (issue 6060, issue 6081)
- Added a missing note about removing the deprecated `scrapy.utils.boto.is_botocore()` function to the 2.8.0 release notes. (issue 6056, issue 6061)
- Other documentation improvements. (issue 6128, issue 6144, issue 6163, issue 6190, issue 6192)

Quality assurance

- Added Python 3.12 to the CI configuration, re-enabled tests that were disabled when the pre-release support was added. (issue 5985, issue 6083, issue 6098)
- Fixed a test issue on PyPy 7.3.14. (issue 6204, issue 6205)

7.1.7 Scrapy 2.11.0 (2023-09-18)

Highlights:

- Spiders can now modify *settings* in their `from_crawler()` methods, e.g. based on *spider arguments*.
- Periodic logging of stats.

Backward-incompatible changes

- Most of the initialization of `scrapy.crawler.Crawler` instances is now done in `crawl()`, so the state of instances before that method is called is now different compared to older Scrapy versions. We do not recommend using the `Crawler` instances before `crawl()` is called. (issue 6038)
- `scrapy.Spider.from_crawler()` is now called before the initialization of various components previously initialized in `scrapy.crawler.Crawler.__init__()` and before the settings are finalized and frozen. This change was needed to allow changing the settings in `scrapy.Spider.from_crawler()`. If you want to access the final setting values and the initialized `Crawler` attributes in the spider code as early as possible you can do this in `scrapy.Spider.start_requests()` or in a handler of the `engine_started` signal. (issue 6038)
- The `TextResponse.json` method now requires the response to be in a valid JSON encoding (UTF-8, UTF-16, or UTF-32). If you need to deal with JSON documents in an invalid encoding, use `json.loads(response.text)` instead. (issue 6016)
- `PythonItemExporter` used the binary output by default but it no longer does. (issue 6006, issue 6007)

Deprecation removals

- Removed the binary export mode of *PythonItemExporter*, deprecated in Scrapy 1.1.0. (issue 6006, issue 6007)

> **Note**
>
> If you are using this Scrapy version on Scrapy Cloud with a stack that includes an older Scrapy version and get a "TypeError: Unexpected options: binary" error, you may need to add `scrapinghub-entrypoint-scrapy >= 0.14.1` to your project requirements or switch to a stack that includes Scrapy 2.11.

- Removed the `CrawlerRunner.spiders` attribute, deprecated in Scrapy 1.0.0, use `CrawlerRunner.spider_loader` instead. (issue 6010)
- The `scrapy.utils.response.response_httprepr()` function, deprecated in Scrapy 2.6.0, has now been removed. (issue 6111)

Deprecations

- Running *crawl()* more than once on the same *scrapy.crawler.Crawler* instance is now deprecated. (issue 1587, issue 6040)

New features

- Spiders can now modify settings in their *from_crawler()* method, e.g. based on *spider arguments*. (issue 1305, issue 1580, issue 2392, issue 3663, issue 6038)
- Added the *PeriodicLog* extension which can be enabled to log stats and/or their differences periodically. (issue 5926)
- Optimized the memory usage in *TextResponse.json* by removing unnecessary body decoding. (issue 5968, issue 6016)
- Links to `.webp` files are now ignored by *link extractors*. (issue 6021)

Bug fixes

- Fixed logging enabled add-ons. (issue 6036)
- Fixed *MailSender* producing invalid message bodies when the `charset` argument is passed to *send()*. (issue 5096, issue 5118)
- Fixed an exception when accessing `self.EXCEPTIONS_TO_RETRY` from a subclass of *RetryMiddleware*. (issue 6049, issue 6050)
- *scrapy.settings.BaseSettings.getdictorlist()*, used to parse *FEED_EXPORT_FIELDS*, now handles tuple values. (issue 6011, issue 6013)
- Calls to `datetime.utcnow()`, no longer recommended to be used, have been replaced with calls to `datetime.now()` with a timezone. (issue 6014)

Documentation

- Updated a deprecated function call in a pipeline example. (issue 6008, issue 6009)

Quality assurance

- Extended typing hints. (issue 6003, issue 6005, issue 6031, issue 6034)
- Pinned brotli to 1.0.9 for the PyPy tests as 1.1.0 breaks them. (issue 6044, issue 6045)
- Other CI and pre-commit improvements. (issue 6002, issue 6013, issue 6046)

7.1.8 Scrapy 2.10.1 (2023-08-30)

Marked `Twisted >= 23.8.0` as unsupported. (issue 6024, issue 6026)

7.1.9 Scrapy 2.10.0 (2023-08-04)

Highlights:

- Added Python 3.12 support, dropped Python 3.7 support.
- The new add-ons framework simplifies configuring 3rd-party components that support it.
- Exceptions to retry can now be configured.
- Many fixes and improvements for feed exports.

Modified requirements

- Dropped support for Python 3.7. (issue 5953)
- Added support for the upcoming Python 3.12. (issue 5984)
- Minimum versions increased for these dependencies:
  - lxml: 4.3.0 → 4.4.1
  - cryptography: 3.4.6 → 36.0.0
- `pkg_resources` is no longer used. (issue 5956, issue 5958)
- boto3 is now recommended instead of botocore for exporting to S3. (issue 5833).

Backward-incompatible changes

- The value of the *`FEED_STORE_EMPTY`* setting is now `True` instead of `False`. In earlier Scrapy versions empty files were created even when this setting was `False` (which was a bug that is now fixed), so the new default should keep the old behavior. (issue 872, issue 5847)

Deprecation removals

- When a function is assigned to the *`FEED_URI_PARAMS`* setting, returning `None` or modifying the `params` input parameter, deprecated in Scrapy 2.6, is no longer supported. (issue 5994, issue 5996)
- The `scrapy.utils.reqser` module, deprecated in Scrapy 2.6, is removed. (issue 5994, issue 5996)
- The `scrapy.squeues` classes `PickleFifoDiskQueueNonRequest`, `PickleLifoDiskQueueNonRequest`, `MarshalFifoDiskQueueNonRequest`, and `MarshalLifoDiskQueueNonRequest`, deprecated in Scrapy 2.6, are removed. (issue 5994, issue 5996)
- The property `open_spiders` and the methods `has_capacity` and `schedule` of *`scrapy.core.engine.ExecutionEngine`*, deprecated in Scrapy 2.6, are removed. (issue 5994, issue 5998)
- Passing a `spider` argument to the `spider_is_idle()`, `crawl()` and `download()` methods of *`scrapy.core.engine.ExecutionEngine`*, deprecated in Scrapy 2.6, is no longer supported. (issue 5994, issue 5998)

Deprecations

- `scrapy.utils.datatypes.CaselessDict` is deprecated, use `scrapy.utils.datatypes.CaseInsensitiveDict` instead. (issue 5146)
- Passing the `custom` argument to `scrapy.utils.conf.build_component_list()` is deprecated, it was used in the past to merge `FOO` and `FOO_BASE` setting values but now Scrapy uses *scrapy.settings.BaseSettings.getwithbase()* to do the same. Code that uses this argument and cannot be switched to `getwithbase()` can be switched to merging the values explicitly. (issue 5726, issue 5923)

New features

- Added support for *Scrapy add-ons*. (issue 5950)
- Added the *RETRY_EXCEPTIONS* setting that configures which exceptions will be retried by *RetryMiddleware*. (issue 2701, issue 5929)
- Added the possiiblity to close the spider if no items were produced in the specified time, configured by *CLOSESPIDER_TIMEOUT_NO_ITEM*. (issue 5979)
- Added support for the *AWS_REGION_NAME* setting to feed exports. (issue 5980)
- Added support for using `pathlib.Path` objects that refer to absolute Windows paths in the *FEEDS* setting. (issue 5939)

Bug fixes

- Fixed creating empty feeds even with `FEED_STORE_EMPTY=False`. (issue 872, issue 5847)
- Fixed using absolute Windows paths when specifying output files. (issue 5969, issue 5971)
- Fixed problems with uploading large files to S3 by switching to multipart uploads (requires boto3). (issue 960, issue 5735, issue 5833)
- Fixed the JSON exporter writing extra commas when some exceptions occur. (issue 3090, issue 5952)
- Fixed the "read of closed file" error in the CSV exporter. (issue 5043, issue 5705)
- Fixed an error when a component added by the class object throws *NotConfigured* with a message. (issue 5950, issue 5992)
- Added the missing *scrapy.settings.BaseSettings.pop()* method. (issue 5959, issue 5960, issue 5963)
- Added `CaseInsensitiveDict` as a replacement for `CaselessDict` that fixes some API inconsistencies. (issue 5146)

Documentation

- Documented *scrapy.Spider.update_settings()*. (issue 5745, issue 5846)
- Documented possible problems with early Twisted reactor installation and their solutions. (issue 5981, issue 6000)
- Added examples of making additional requests in callbacks. (issue 5927)
- Improved the feed export docs. (issue 5579, issue 5931)
- Clarified the docs about request objects on redirection. (issue 5707, issue 5937)

Quality assurance

- Added support for running tests against the installed Scrapy version. (issue 4914, issue 5949)
- Extended typing hints. (issue 5925, issue 5977)
- Fixed the `test_utils_asyncio.AsyncioTest.test_set_asyncio_event_loop` test. (issue 5951)
- Fixed the `test_feedexport.BatchDeliveriesTest.test_batch_path_differ` test on Windows. (issue 5847)
- Enabled CI runs for Python 3.11 on Windows. (issue 5999)
- Simplified skipping tests that depend on `uvloop`. (issue 5984)
- Fixed the `extra-deps-pinned` tox env. (issue 5948)
- Implemented cleanups. (issue 5965, issue 5986)

7.1.10 Scrapy 2.9.0 (2023-05-08)

Highlights:

- Per-domain download settings.
- Compatibility with new cryptography and new parsel.
- JMESPath selectors from the new parsel.
- Bug fixes.

Deprecations

- `scrapy.extensions.feedexport._FeedSlot` is renamed to `scrapy.extensions.feedexport.FeedSlot` and the old name is deprecated. (issue 5876)

New features

- Settings corresponding to *DOWNLOAD_DELAY*, *CONCURRENT_REQUESTS_PER_DOMAIN* and *RANDOMIZE_DOWNLOAD_DELAY* can now be set on a per-domain basis via the new *DOWNLOAD_SLOTS* setting. (issue 5328)
- Added *TextResponse.jmespath()*, a shortcut for JMESPath selectors available since parsel 1.8.1. (issue 5894, issue 5915)
- Added *feed_slot_closed* and *feed_exporter_closed* signals. (issue 5876)
- Added `scrapy.utils.request.request_to_curl()`, a function to produce a curl command from a *Request* object. (issue 5892)
- Values of *FILES_STORE* and *IMAGES_STORE* can now be `pathlib.Path` instances. (issue 5801)

Bug fixes

- Fixed a warning with Parsel 1.8.1+. (issue 5903, issue 5918)
- Fixed an error when using feed postprocessing with S3 storage. (issue 5500, issue 5581)
- Added the missing *scrapy.settings.BaseSettings.setdefault()* method. (issue 5811, issue 5821)
- Fixed an error when using cryptography 40.0.0+ and *DOWNLOADER_CLIENT_TLS_VERBOSE_LOGGING* is enabled. (issue 5857, issue 5858)
- The checksums returned by *FilesPipeline* for files on Google Cloud Storage are no longer Base64-encoded. (issue 5874, issue 5891)

- `scrapy.utils.request.request_from_curl()` now supports $-prefixed string values for the curl `--data-raw` argument, which are produced by browsers for data that includes certain symbols. (issue 5899, issue 5901)
- The *`parse`* command now also works with async generator callbacks. (issue 5819, issue 5824)
- The *`genspider`* command now properly works with HTTPS URLs. (issue 3553, issue 5808)
- Improved handling of asyncio loops. (issue 5831, issue 5832)
- *`LinkExtractor`* now skips certain malformed URLs instead of raising an exception. (issue 5881)
- `scrapy.utils.python.get_func_args()` now supports more types of callables. (issue 5872, issue 5885)
- Fixed an error when processing non-UTF8 values of `Content-Type` headers. (issue 5914, issue 5917)
- Fixed an error breaking user handling of send failures in *`scrapy.mail.MailSender.send()`*. (issue 1611, issue 5880)

Documentation

- Expanded contributing docs. (issue 5109, issue 5851)
- Added blacken-docs to pre-commit and reformatted the docs with it. (issue 5813, issue 5816)
- Fixed a JS issue. (issue 5875, issue 5877)
- Fixed `make htmlview`. (issue 5878, issue 5879)
- Fixed typos and other small errors. (issue 5827, issue 5839, issue 5883, issue 5890, issue 5895, issue 5904)

Quality assurance

- Extended typing hints. (issue 5805, issue 5889, issue 5896)
- Tests for most of the examples in the docs are now run as a part of CI, found problems were fixed. (issue 5816, issue 5826, issue 5919)
- Removed usage of deprecated Python classes. (issue 5849)
- Silenced `include-ignored` warnings from coverage. (issue 5820)
- Fixed a random failure of the `test_feedexport.test_batch_path_differ` test. (issue 5855, issue 5898)
- Updated docstrings to match output produced by parsel 1.8.1 so that they don't cause test failures. (issue 5902, issue 5919)
- Other CI and pre-commit improvements. (issue 5802, issue 5823, issue 5908)

7.1.11 Scrapy 2.8.0 (2023-02-02)

This is a maintenance release, with minor features, bug fixes, and cleanups.

Deprecation removals

- The `scrapy.utils.gz.read1` function, deprecated in Scrapy 2.0, has now been removed. Use the `read1()` method of `GzipFile` instead. (issue 5719)
- The `scrapy.utils.python.to_native_str` function, deprecated in Scrapy 2.0, has now been removed. Use `scrapy.utils.python.to_unicode()` instead. (issue 5719)
- The `scrapy.utils.python.MutableChain.next` method, deprecated in Scrapy 2.0, has now been removed. Use `__next__()` instead. (issue 5719)

- The `scrapy.linkextractors.FilteringLinkExtractor` class, deprecated in Scrapy 2.0, has now been removed. Use *`LinkExtractor`* instead. (issue 5720)
- Support for using environment variables prefixed with `SCRAPY_` to override settings, deprecated in Scrapy 2.0, has now been removed. (issue 5724)
- Support for the `noconnect` query string argument in proxy URLs, deprecated in Scrapy 2.0, has now been removed. We expect proxies that used to need it to work fine without it. (issue 5731)
- The `scrapy.utils.python.retry_on_eintr` function, deprecated in Scrapy 2.3, has now been removed. (issue 5719)
- The `scrapy.utils.python.WeakKeyCache` class, deprecated in Scrapy 2.4, has now been removed. (issue 5719)
- The `scrapy.utils.boto.is_botocore()` function, deprecated in Scrapy 2.4, has now been removed. (issue 5719)

Deprecations

- `scrapy.pipelines.images.NoimagesDrop` is now deprecated. (issue 5368, issue 5489)
- `ImagesPipeline.convert_image` must now accept a `response_body` parameter. (issue 3055, issue 3689, issue 4753)

New features

- Applied black coding style to files generated with the *`genspider`* and *`startproject`* commands. (issue 5809, issue 5814)
- *`FEED_EXPORT_ENCODING`* is now set to `"utf-8"` in the `settings.py` file that the *`startproject`* command generates. With this value, JSON exports won't force the use of escape sequences for non-ASCII characters. (issue 5797, issue 5800)
- The *`MemoryUsage`* extension now logs the peak memory usage during checks, and the binary unit MiB is now used to avoid confusion. (issue 5717, issue 5722, issue 5727)
- The `callback` parameter of *`Request`* can now be set to *`scrapy.http.request.NO_CALLBACK()`*, to distinguish it from `None`, as the latter indicates that the default spider callback (*`parse()`*) is to be used. (issue 5798)

Bug fixes

- Enabled unsafe legacy SSL renegotiation to fix access to some outdated websites. (issue 5491, issue 5790)
- Fixed STARTTLS-based email delivery not working with Twisted 21.2.0 and better. (issue 5386, issue 5406)
- Fixed the `finish_exporting()` method of *item exporters* not being called for empty files. (issue 5537, issue 5758)
- Fixed HTTP/2 responses getting only the last value for a header when multiple headers with the same name are received. (issue 5777)
- Fixed an exception raised by the *`shell`* command on some cases when *using asyncio*. (issue 5740, issue 5742, issue 5748, issue 5759, issue 5760, issue 5771)
- When using *`CrawlSpider`*, callback keyword arguments (`cb_kwargs`) added to a request in the `process_request` callback of a *`Rule`* will no longer be ignored. (issue 5699)
- The *images pipeline* no longer re-encodes JPEG files. (issue 3055, issue 3689, issue 4753)
- Fixed the handling of transparent WebP images by the *images pipeline*. (issue 3072, issue 5766, issue 5767)
- `scrapy.shell.inspect_response()` no longer inhibits `SIGINT` (Ctrl+C). (issue 2918)

- *LinkExtractor* with `unique=False` no longer filters out links that have identical URL *and* text. (issue 3798, issue 3799, issue 4695, issue 5458)
- *RobotsTxtMiddleware* now ignores URL protocols that do not support `robots.txt` (`data://`, `file://`). (issue 5807)
- Silenced the `filelock` debug log messages introduced in Scrapy 2.6. (issue 5753, issue 5754)
- Fixed the output of `scrapy -h` showing an unintended `**commands**` line. (issue 5709, issue 5711, issue 5712)
- Made the active project indication in the output of *commands* more clear. (issue 5715)

Documentation

- Documented how to *debug spiders from Visual Studio Code*. (issue 5721)
- Documented how *DOWNLOAD_DELAY* affects per-domain concurrency. (issue 5083, issue 5540)
- Improved consistency. (issue 5761)
- Fixed typos. (issue 5714, issue 5744, issue 5764)

Quality assurance

- Applied *black coding style*, sorted import statements, and introduced *pre-commit*. (issue 4654, issue 4658, issue 5734, issue 5737, issue 5806, issue 5810)
- Switched from `os.path` to `pathlib`. (issue 4916, issue 4497, issue 5682)
- Addressed many issues reported by Pylint. (issue 5677)
- Improved code readability. (issue 5736)
- Improved package metadata. (issue 5768)
- Removed direct invocations of `setup.py`. (issue 5774, issue 5776)
- Removed unnecessary `OrderedDict` usages. (issue 5795)
- Removed unnecessary `__str__` definitions. (issue 5150)
- Removed obsolete code and comments. (issue 5725, issue 5729, issue 5730, issue 5732)
- Fixed test and CI issues. (issue 5749, issue 5750, issue 5756, issue 5762, issue 5765, issue 5780, issue 5781, issue 5782, issue 5783, issue 5785, issue 5786)

7.1.12 Scrapy 2.7.1 (2022-11-02)

New features

- Relaxed the restriction introduced in 2.6.2 so that the `Proxy-Authorization` header can again be set explicitly, as long as the proxy URL in the *proxy* metadata has no other credentials, and for as long as that proxy URL remains the same; this restores compatibility with scrapy-zyte-smartproxy 2.1.0 and older (issue 5626).

Bug fixes

- Using `-O`/`--overwrite-output` and `-t`/`--output-format` options together now produces an error instead of ignoring the former option (issue 5516, issue 5605).
- Replaced deprecated `asyncio` APIs that implicitly use the current event loop with code that explicitly requests a loop from the event loop policy (issue 5685, issue 5689).
- Fixed uses of deprecated Scrapy APIs in Scrapy itself (issue 5588, issue 5589).

- Fixed uses of a deprecated Pillow API (issue 5684, issue 5692).
- Improved code that checks if generators return values, so that it no longer fails on decorated methods and partial methods (issue 5323, issue 5592, issue 5599, issue 5691).

Documentation

- Upgraded the Code of Conduct to Contributor Covenant v2.1 (issue 5698).
- Fixed typos (issue 5681, issue 5694).

Quality assurance

- Re-enabled some erroneously disabled flake8 checks (issue 5688).
- Ignored harmless deprecation warnings from `typing` in tests (issue 5686, issue 5697).
- Modernized our CI configuration (issue 5695, issue 5696).

7.1.13 Scrapy 2.7.0 (2022-10-17)

Highlights:

- Added Python 3.11 support, dropped Python 3.6 support
- Improved support for *asynchronous callbacks*
- *Asyncio support* is enabled by default on new projects
- Output names of item fields can now be arbitrary strings
- Centralized *request fingerprinting* configuration is now possible

Modified requirements

Python 3.7 or greater is now required; support for Python 3.6 has been dropped. Support for the upcoming Python 3.11 has been added.

The minimum required version of some dependencies has changed as well:

- lxml: 3.5.0 → 4.3.0
- Pillow (*images pipeline*): 4.0.0 → 7.1.0
- zope.interface: 5.0.0 → 5.1.0

(issue 5512, issue 5514, issue 5524, issue 5563, issue 5664, issue 5670, issue 5678)

Deprecations

- *`ImagesPipeline.thumb_path`* must now accept an `item` parameter (issue 5504, issue 5508).
- The `scrapy.downloadermiddlewares.decompression` module is now deprecated (issue 5546, issue 5547).

New features

- The *`process_spider_output()`* method of *spider middlewares* can now be defined as an asynchronous generator (issue 4978).
- The output of *`Request`* callbacks defined as *coroutines* is now processed asynchronously (issue 4978).
- `CrawlSpider` now supports *asynchronous callbacks* (issue 5657).
- New projects created with the *`startproject`* command have *asyncio support* enabled by default (issue 5590, issue 5679).

- The *FEED_EXPORT_FIELDS* setting can now be defined as a dictionary to customize the output name of item fields, lifting the restriction that required output names to be valid Python identifiers, e.g. preventing them to have whitespace (issue 1008, issue 3266, issue 3696).
- You can now customize *request fingerprinting* through the new *REQUEST_FINGERPRINTER_CLASS* setting, instead of having to change it on every Scrapy component that relies on request fingerprinting (issue 900, issue 3420, issue 4113, issue 4762, issue 4524).
- `jsonl` is now supported and encouraged as a file extension for JSON Lines files (issue 4848).
- *ImagesPipeline.thumb_path* now receives the source *item* (issue 5504, issue 5508).

Bug fixes

- When using Google Cloud Storage with a *media pipeline*, *FILES_EXPIRES* now also works when *FILES_STORE* does not point at the root of your Google Cloud Storage bucket (issue 5317, issue 5318).
- The *parse* command now supports *asynchronous callbacks* (issue 5424, issue 5577).
- When using the *parse* command with a URL for which there is no available spider, an exception is no longer raised (issue 3264, issue 3265, issue 5375, issue 5376, issue 5497).
- *TextResponse* now gives higher priority to the byte order mark when determining the text encoding of the response body, following the HTML living standard (issue 5601, issue 5611).
- MIME sniffing takes the response body into account in FTP and HTTP/1.0 requests, as well as in cached requests (issue 4873).
- MIME sniffing now detects valid HTML 5 documents even if the `html` tag is missing (issue 4873).
- An exception is now raised if *ASYNCIO_EVENT_LOOP* has a value that does not match the asyncio event loop actually installed (issue 5529).
- Fixed `Headers.getlist` returning only the last header (issue 5515, issue 5526).
- Fixed *LinkExtractor* not ignoring the `tar.gz` file extension by default (issue 1837, issue 2067, issue 4066)

Documentation

- Clarified the return type of *Spider.parse* (issue 5602, issue 5608).
- To enable *HttpCompressionMiddleware* to do brotli compression, installing brotli is now recommended instead of installing brotlipy, as the former provides a more recent version of brotli.
- *Signal documentation* now mentions *coroutine support* and uses it in code examples (issue 4852, issue 5358).
- *Avoiding getting banned* now recommends Common Crawl instead of Google cache (issue 3582, issue 5432).
- The new *Components* topic covers enforcing requirements on Scrapy components, like *downloader middlewares*, *extensions*, *item pipelines*, *spider middlewares*, and more; *Enforcing asyncio as a requirement* has also been added (issue 4978).
- *Settings* now indicates that setting values must be picklable (issue 5607, issue 5629).
- Removed outdated documentation (issue 5446, issue 5373, issue 5369, issue 5370, issue 5554).
- Fixed typos (issue 5442, issue 5455, issue 5457, issue 5461, issue 5538, issue 5553, issue 5558, issue 5624, issue 5631).
- Fixed other issues (issue 5283, issue 5284, issue 5559, issue 5567, issue 5648, issue 5659, issue 5665).

Quality assurance

- Added a continuous integration job to run twine check (issue 5655, issue 5656).
- Addressed test issues and warnings (issue 5560, issue 5561, issue 5612, issue 5617, issue 5639, issue 5645, issue 5662, issue 5671, issue 5675).
- Cleaned up code (issue 4991, issue 4995, issue 5451, issue 5487, issue 5542, issue 5667, issue 5668, issue 5672).
- Applied minor code improvements (issue 5661).

7.1.14 Scrapy 2.6.3 (2022-09-27)

- Added support for pyOpenSSL 22.1.0, removing support for SSLv3 (issue 5634, issue 5635, issue 5636).
- Upgraded the minimum versions of the following dependencies:
  - cryptography: 2.0 → 3.3
  - pyOpenSSL: 16.2.0 → 21.0.0
  - service_identity: 16.0.0 → 18.1.0
  - Twisted: 17.9.0 → 18.9.0
  - zope.interface: 4.1.3 → 5.0.0

  (issue 5621, issue 5632)
- Fixes test and documentation issues (issue 5612, issue 5617, issue 5631).

7.1.15 Scrapy 2.6.2 (2022-07-25)

Security bug fix:

- When *HttpProxyMiddleware* processes a request with *proxy* metadata, and that *proxy* metadata includes proxy credentials, *HttpProxyMiddleware* sets the `Proxy-Authorization` header, but only if that header is not already set.

  There are third-party proxy-rotation downloader middlewares that set different *proxy* metadata every time they process a request.

  Because of request retries and redirects, the same request can be processed by downloader middlewares more than once, including both *HttpProxyMiddleware* and any third-party proxy-rotation downloader middleware.

  These third-party proxy-rotation downloader middlewares could change the *proxy* metadata of a request to a new value, but fail to remove the `Proxy-Authorization` header from the previous value of the *proxy* metadata, causing the credentials of one proxy to be sent to a different proxy.

  To prevent the unintended leaking of proxy credentials, the behavior of *HttpProxyMiddleware* is now as follows when processing a request:

  - If the request being processed defines *proxy* metadata that includes credentials, the `Proxy-Authorization` header is always updated to feature those credentials.
  - If the request being processed defines *proxy* metadata without credentials, the `Proxy-Authorization` header is removed *unless* it was originally defined for the same proxy URL.

    To remove proxy credentials while keeping the same proxy URL, remove the `Proxy-Authorization` header.
  - If the request has no *proxy* metadata, or that metadata is a falsy value (e.g. `None`), the `Proxy-Authorization` header is removed.

It is no longer possible to set a proxy URL through the *proxy* metadata but set the credentials through the `Proxy-Authorization` header. Set proxy credentials through the *proxy* metadata instead.

Also fixes the following regressions introduced in 2.6.0:

- *CrawlerProcess* supports again crawling multiple spiders (issue 5435, issue 5436)
- Installing a Twisted reactor before Scrapy does (e.g. importing `twisted.internet.reactor` somewhere at the module level) no longer prevents Scrapy from starting, as long as a different reactor is not specified in *TWISTED_REACTOR* (issue 5525, issue 5528)
- Fixed an exception that was being logged after the spider finished under certain conditions (issue 5437, issue 5440)
- The `--output/-o` command-line parameter supports again a value starting with a hyphen (issue 5444, issue 5445)
- The `scrapy parse -h` command no longer throws an error (issue 5481, issue 5482)

7.1.16 Scrapy 2.6.1 (2022-03-01)

Fixes a regression introduced in 2.6.0 that would unset the request method when following redirects.

7.1.17 Scrapy 2.6.0 (2022-03-01)

Highlights:

- *Security fixes for cookie handling*
- Python 3.10 support
- *asyncio support* is no longer considered experimental, and works out-of-the-box on Windows regardless of your Python version
- Feed exports now support `pathlib.Path` output paths and per-feed *item filtering* and *post-processing*

Security bug fixes

- When a *Request* object with cookies defined gets a redirect response causing a new *Request* object to be scheduled, the cookies defined in the original *Request* object are no longer copied into the new *Request* object.

  If you manually set the `Cookie` header on a *Request* object and the domain name of the redirect URL is not an exact match for the domain of the URL of the original *Request* object, your `Cookie` header is now dropped from the new *Request* object.

  The old behavior could be exploited by an attacker to gain access to your cookies. Please, see the cjvr-mfj7-j4j8 security advisory for more information.

  > **Note**
  >
  > It is still possible to enable the sharing of cookies between different domains with a shared domain suffix (e.g. `example.com` and any subdomain) by defining the shared domain suffix (e.g. `example.com`) as the cookie domain when defining your cookies. See the documentation of the *Request* class for more information.

- When the domain of a cookie, either received in the `Set-Cookie` header of a response or defined in a *Request* object, is set to a public suffix, the cookie is now ignored unless the cookie domain is the same as the request domain.

The old behavior could be exploited by an attacker to inject cookies from a controlled domain into your cookiejar that could be sent to other domains not controlled by the attacker. Please, see the mfjm-vh54-3f96 security advisory for more information.

Modified requirements

- The h2 dependency is now optional, only needed to *enable HTTP/2 support*. (issue 5113)

Backward-incompatible changes

- The `formdata` parameter of *`FormRequest`*, if specified for a non-POST request, now overrides the URL query string, instead of being appended to it. (issue 2919, issue 3579)
- When a function is assigned to the *`FEED_URI_PARAMS`* setting, now the return value of that function, and not the `params` input parameter, will determine the feed URI parameters, unless that return value is `None`. (issue 4962, issue 4966)
- In *`scrapy.core.engine.ExecutionEngine`*, methods `crawl()`, `download()`, `schedule()`, and `spider_is_idle()` now raise `RuntimeError` if called before `open_spider()`. (issue 5090)

  These methods used to assume that `ExecutionEngine.slot` had been defined by a prior call to `open_spider()`, so they were raising `AttributeError` instead.
- If the API of the configured *scheduler* does not meet expectations, `TypeError` is now raised at startup time. Before, other exceptions would be raised at run time. (issue 3559)
- The `_encoding` field of serialized *`Request`* objects is now named `encoding`, in line with all other fields (issue 5130)

Deprecation removals

- `scrapy.http.TextResponse.body_as_unicode`, deprecated in Scrapy 2.2, has now been removed. (issue 5393)
- `scrapy.item.BaseItem`, deprecated in Scrapy 2.2, has now been removed. (issue 5398)
- `scrapy.item.DictItem`, deprecated in Scrapy 1.8, has now been removed. (issue 5398)
- `scrapy.Spider.make_requests_from_url`, deprecated in Scrapy 1.4, has now been removed. (issue 4178, issue 4356)

Deprecations

- When a function is assigned to the *`FEED_URI_PARAMS`* setting, returning `None` or modifying the `params` input parameter is now deprecated. Return a new dictionary instead. (issue 4962, issue 4966)
- `scrapy.utils.reqser` is deprecated. (issue 5130)
  - Instead of `request_to_dict()`, use the new *`Request.to_dict()`* method.
  - Instead of `request_from_dict()`, use the new *`scrapy.utils.request.request_from_dict()`* function.
- In `scrapy.squeues`, the following queue classes are deprecated: `PickleFifoDiskQueueNonRequest`, `PickleLifoDiskQueueNonRequest`, `MarshalFifoDiskQueueNonRequest`, and `MarshalLifoDiskQueueNonRequest`. You should instead use: `PickleFifoDiskQueue`, `PickleLifoDiskQueue`, `MarshalFifoDiskQueue`, and `MarshalLifoDiskQueue`. (issue 5117)
- Many aspects of *`scrapy.core.engine.ExecutionEngine`* that come from a time when this class could handle multiple *`Spider`* objects at a time have been deprecated. (issue 5090)
  - The `has_capacity()` method is deprecated.

  - The `schedule()` method is deprecated, use `crawl()` or `download()` instead.
  - The `open_spiders` attribute is deprecated, use `spider` instead.
  - The `spider` parameter is deprecated for the following methods:
    * `spider_is_idle()`
    * `crawl()`
    * `download()`

    Instead, call `open_spider()` first to set the *`Spider`* object.

- `scrapy.utils.response.response_httprepr()` is now deprecated. (issue 4972)

New features

- You can now use *item filtering* to control which items are exported to each output feed. (issue 4575, issue 5178, issue 5161, issue 5203)
- You can now apply *post-processing* to feeds, and *built-in post-processing plugins* are provided for output file compression. (issue 2174, issue 5168, issue 5190)
- The *`FEEDS`* setting now supports `pathlib.Path` objects as keys. (issue 5383, issue 5384)
- Enabling *asyncio* while using Windows and Python 3.8 or later will automatically switch the asyncio event loop to one that allows Scrapy to work. See *Windows-specific notes*. (issue 4976, issue 5315)
- The *`genspider`* command now supports a start URL instead of a domain name. (issue 4439)
- `scrapy.utils.defer` gained 2 new functions, *`deferred_to_future()`* and *`maybe_deferred_to_future()`*, to help *await on Deferreds when using the asyncio reactor*. (issue 5288)
- *Amazon S3 feed export storage* gained support for temporary security credentials (*`AWS_SESSION_TOKEN`*) and endpoint customization (*`AWS_ENDPOINT_URL`*). (issue 4998, issue 5210)
- New *`LOG_FILE_APPEND`* setting to allow truncating the log file. (issue 5279)
- `Request.cookies` values that are `bool`, `float` or `int` are cast to `str`. (issue 5252, issue 5253)
- You may now raise *`CloseSpider`* from a handler of the *`spider_idle`* signal to customize the reason why the spider is stopping. (issue 5191)
- When using *`HttpProxyMiddleware`*, the proxy URL for non-HTTPS HTTP/1.1 requests no longer needs to include a URL scheme. (issue 4505, issue 4649)
- All built-in queues now expose a `peek` method that returns the next queue object (like `pop`) but does not remove the returned object from the queue. (issue 5112)

  If the underlying queue does not support peeking (e.g. because you are not using `queuelib` 1.6.1 or later), the `peek` method raises `NotImplementedError`.
- *`Request`* and *`Response`* now have an `attributes` attribute that makes subclassing easier. For *`Request`*, it also allows subclasses to work with *`scrapy.utils.request.request_from_dict()`*. (issue 1877, issue 5130, issue 5218)
- The *`open()`* and *`close()`* methods of the *scheduler* are now optional. (issue 3559)
- HTTP/1.1 `TunnelError` exceptions now only truncate response bodies longer than 1000 characters, instead of those longer than 32 characters, making it easier to debug such errors. (issue 4881, issue 5007)
- *`ItemLoader`* now supports non-text responses. (issue 5145, issue 5269)

Bug fixes

- The *TWISTED_REACTOR* and *ASYNCIO_EVENT_LOOP* settings are no longer ignored if defined in *custom_settings*. (issue 4485, issue 5352)
- Removed a module-level Twisted reactor import that could prevent *using the asyncio reactor*. (issue 5357)
- The *startproject* command works with existing folders again. (issue 4665, issue 4676)
- The *FEED_URI_PARAMS* setting now behaves as documented. (issue 4962, issue 4966)
- *Request.cb_kwargs* once again allows the `callback` keyword. (issue 5237, issue 5251, issue 5264)
- Made *scrapy.utils.response.open_in_browser()* support more complex HTML. (issue 5319, issue 5320)
- Fixed *CSVFeedSpider.quotechar* being interpreted as the CSV file encoding. (issue 5391, issue 5394)
- Added missing setuptools to the list of dependencies. (issue 5122)
- *LinkExtractor* now also works as expected with links that have comma-separated `rel` attribute values including `nofollow`. (issue 5225)
- Fixed a `TypeError` that could be raised during *feed export* parameter parsing. (issue 5359)

Documentation

- *asyncio support* is no longer considered experimental. (issue 5332)
- Included *Windows-specific help for asyncio usage*. (issue 4976, issue 5315)
- Rewrote *Using a headless browser* with up-to-date best practices. (issue 4484, issue 4613)
- Documented *local file naming in media pipelines*. (issue 5069, issue 5152)
- *Frequently Asked Questions* now covers spider file name collision issues. (issue 2680, issue 3669)
- Provided better context and instructions to disable the *URLLENGTH_LIMIT* setting. (issue 5135, issue 5250)
- Documented that Reppy parser does not support Python 3.9+. (issue 5226, issue 5231)
- Documented *the scheduler component*. (issue 3537, issue 3559)
- Documented the method used by *media pipelines* to *determine if a file has expired*. (issue 5120, issue 5254)
- *Running multiple spiders in the same process* now features `scrapy.utils.project.get_project_settings()` usage. (issue 5070)
- *Running multiple spiders in the same process* now covers what happens when you define different per-spider values for some settings that cannot differ at run time. (issue 4485, issue 5352)
- Extended the documentation of the *StatsMailer* extension. (issue 5199, issue 5217)
- Added *JOBDIR* to *Settings*. (issue 5173, issue 5224)
- Documented `Spider.attribute`. (issue 5174, issue 5244)
- Documented *TextResponse.urljoin*. (issue 1582)
- Added the `body_length` parameter to the documented signature of the *headers_received* signal. (issue 5270)
- Clarified *SelectorList.get* usage in the *tutorial*. (issue 5256)
- The documentation now features the shortest import path of classes with multiple import paths. (issue 2733, issue 5099)
- `quotes.toscrape.com` references now use HTTPS instead of HTTP. (issue 5395, issue 5396)
- Added a link to our Discord server to *Getting help*. (issue 5421, issue 5422)

- The pronunciation of the project name is now *officially* /skrepa/. (issue 5280, issue 5281)
- Added the Scrapy logo to the README. (issue 5255, issue 5258)
- Fixed issues and implemented minor improvements. (issue 3155, issue 4335, issue 5074, issue 5098, issue 5134, issue 5180, issue 5194, issue 5239, issue 5266, issue 5271, issue 5273, issue 5274, issue 5276, issue 5347, issue 5356, issue 5414, issue 5415, issue 5416, issue 5419, issue 5420)

Quality Assurance

- Added support for Python 3.10. (issue 5212, issue 5221, issue 5265)
- Significantly reduced memory usage by `scrapy.utils.response.response_httprepr()`, used by the *`DownloaderStats`* downloader middleware, which is enabled by default. (issue 4964, issue 4972)
- Removed uses of the deprecated `optparse` module. (issue 5366, issue 5374)
- Extended typing hints. (issue 5077, issue 5090, issue 5100, issue 5108, issue 5171, issue 5215, issue 5334)
- Improved tests, fixed CI issues, removed unused code. (issue 5094, issue 5157, issue 5162, issue 5198, issue 5207, issue 5208, issue 5229, issue 5298, issue 5299, issue 5310, issue 5316, issue 5333, issue 5388, issue 5389, issue 5400, issue 5401, issue 5404, issue 5405, issue 5407, issue 5410, issue 5412, issue 5425, issue 5427)
- Implemented improvements for contributors. (issue 5080, issue 5082, issue 5177, issue 5200)
- Implemented cleanups. (issue 5095, issue 5106, issue 5209, issue 5228, issue 5235, issue 5245, issue 5246, issue 5292, issue 5314, issue 5322)

7.1.18 Scrapy 2.5.1 (2021-10-05)

- **Security bug fix:**

  If you use *`HttpAuthMiddleware`* (i.e. the `http_user` and `http_pass` spider attributes) for HTTP authentication, any request exposes your credentials to the request target.

  To prevent unintended exposure of authentication credentials to unintended domains, you must now additionally set a new, additional spider attribute, `http_auth_domain`, and point it to the specific domain to which the authentication credentials must be sent.

  If the `http_auth_domain` spider attribute is not set, the domain of the first request will be considered the HTTP authentication target, and authentication credentials will only be sent in requests targeting that domain.

  If you need to send the same HTTP authentication credentials to multiple domains, you can use `w3lib.http.basic_auth_header()` instead to set the value of the `Authorization` header of your requests.

  If you *really* want your spider to send the same HTTP authentication credentials to any domain, set the `http_auth_domain` spider attribute to `None`.

  Finally, if you are a user of scrapy-splash, know that this version of Scrapy breaks compatibility with scrapy-splash 0.7.2 and earlier. You will need to upgrade scrapy-splash to a greater version for it to continue to work.

7.1.19 Scrapy 2.5.0 (2021-04-06)

Highlights:

- Official Python 3.9 support
- Experimental *HTTP/2 support*
- New *`get_retry_request()`* function to retry requests from spider callbacks
- New *`headers_received`* signal that allows stopping downloads early
- New *`Response.protocol`* attribute

Deprecation removals

- Removed all code that *was deprecated in 1.7.0* and had not *already been removed in 2.4.0*. (issue 4901)
- Removed support for the `SCRAPY_PICKLED_SETTINGS_TO_OVERRIDE` environment variable, *deprecated in 1.8.0*. (issue 4912)

Deprecations

- The `scrapy.utils.py36` module is now deprecated in favor of `scrapy.utils.asyncgen`. (issue 4900)

New features

- Experimental *HTTP/2 support* through a new download handler that can be assigned to the `https` protocol in the *DOWNLOAD_HANDLERS* setting. (issue 1854, issue 4769, issue 5058, issue 5059, issue 5066)
- The new *scrapy.downloadermiddlewares.retry.get_retry_request()* function may be used from spider callbacks or middlewares to handle the retrying of a request beyond the scenarios that *RetryMiddleware* supports. (issue 3590, issue 3685, issue 4902)
- The new *headers_received* signal gives early access to response headers and allows *stopping downloads*. (issue 1772, issue 4897)
- The new *Response.protocol* attribute gives access to the string that identifies the protocol used to download a response. (issue 4878)
- *Stats* now include the following entries that indicate the number of successes and failures in storing *feeds*:

```
feedexport/success_count/<storage type>
feedexport/failed_count/<storage type>
```

  Where `<storage type>` is the feed storage backend class name, such as `FileFeedStorage` or `FTPFeedStorage`.

  (issue 3947, issue 4850)

- The *UrlLengthMiddleware* spider middleware now logs ignored URLs with `INFO` logging level instead of `DEBUG`, and it now includes the following entry into *stats* to keep track of the number of ignored URLs:

```
urllength/request_ignored_count
```

  (issue 5036)

- The *HttpCompressionMiddleware* downloader middleware now logs the number of decompressed responses and the total count of resulting bytes:

```
httpcompression/response_bytes
httpcompression/response_count
```

  (issue 4797, issue 4799)

Bug fixes

- Fixed installation on PyPy installing PyDispatcher in addition to PyPyDispatcher, which could prevent Scrapy from working depending on which package got imported. (issue 4710, issue 4814)
- When inspecting a callback to check if it is a generator that also returns a value, an exception is no longer raised if the callback has a docstring with lower indentation than the following code. (issue 4477, issue 4935)
- The Content-Length header is no longer omitted from responses when using the default, HTTP/1.1 download handler (see *DOWNLOAD_HANDLERS*). (issue 5009, issue 5034, issue 5045, issue 5057, issue 5062)

- Setting the `handle_httpstatus_all` request meta key to `False` now has the same effect as not setting it at all, instead of having the same effect as setting it to `True`. (issue 3851, issue 4694)

Documentation

- Added instructions to *install Scrapy in Windows using pip*. (issue 4715, issue 4736)
- Logging documentation now includes *additional ways to filter logs*. (issue 4216, issue 4257, issue 4965)
- Covered how to deal with long lists of allowed domains in the *FAQ*. (issue 2263, issue 3667)
- Covered scrapy-bench in *Benchmarking*. (issue 4996, issue 5016)
- Clarified that one *extension* instance is created per crawler. (issue 5014)
- Fixed some errors in examples. (issue 4829, issue 4830, issue 4907, issue 4909, issue 5008)
- Fixed some external links, typos, and so on. (issue 4892, issue 4899, issue 4936, issue 4942, issue 5005, issue 5063)
- The *list of Request.meta keys* is now sorted alphabetically. (issue 5061, issue 5065)
- Updated references to Scrapinghub, which is now called Zyte. (issue 4973, issue 5072)
- Added a mention to contributors in the README. (issue 4956)
- Reduced the top margin of lists. (issue 4974)

Quality Assurance

- Made Python 3.9 support official (issue 4757, issue 4759)
- Extended typing hints (issue 4895)
- Fixed deprecated uses of the Twisted API. (issue 4940, issue 4950, issue 5073)
- Made our tests run with the new pip resolver. (issue 4710, issue 4814)
- Added tests to ensure that *coroutine support* is tested. (issue 4987)
- Migrated from Travis CI to GitHub Actions. (issue 4924)
- Fixed CI issues. (issue 4986, issue 5020, issue 5022, issue 5027, issue 5052, issue 5053)
- Implemented code refactorings, style fixes and cleanups. (issue 4911, issue 4982, issue 5001, issue 5002, issue 5076)

7.1.20 Scrapy 2.4.1 (2020-11-17)

- Fixed *feed exports* overwrite support (issue 4845, issue 4857, issue 4859)
- Fixed the AsyncIO event loop handling, which could make code hang (issue 4855, issue 4872)
- Fixed the IPv6-capable DNS resolver `CachingHostnameResolver` for download handlers that call `reactor.resolve` (issue 4802, issue 4803)
- Fixed the output of the `genspider` command showing placeholders instead of the import path of the generated spider module (issue 4874)
- Migrated Windows CI from Azure Pipelines to GitHub Actions (issue 4869, issue 4876)

7.1.21 Scrapy 2.4.0 (2020-10-11)

Highlights:

- Python 3.5 support has been dropped.
- The `file_path` method of *media pipelines* can now access the source *item*.

  This allows you to set a download file path based on item data.
- The new `item_export_kwargs` key of the `FEEDS` setting allows to define keyword parameters to pass to *item exporter classes*
- You can now choose whether *feed exports* overwrite or append to the output file.

  For example, when using the `crawl` or `runspider` commands, you can use the `-O` option instead of `-o` to overwrite the output file.
- Zstd-compressed responses are now supported if zstandard is installed.
- In settings, where the import path of a class is required, it is now possible to pass a class object instead.

Modified requirements

- Python 3.6 or greater is now required; support for Python 3.5 has been dropped

  As a result:

  - When using PyPy, PyPy 7.2.0 or greater *is now required*
  - For Amazon S3 storage support in *feed exports* or *media pipelines*, botocore 1.4.87 or greater is now required
  - To use the *images pipeline*, Pillow 4.0.0 or greater is now required

  (issue 4718, issue 4732, issue 4733, issue 4742, issue 4743, issue 4764)

Backward-incompatible changes

- `CookiesMiddleware` once again discards cookies defined in `Request.headers`.

  We decided to revert this bug fix, introduced in Scrapy 2.2.0, because it was reported that the current implementation could break existing code.

  If you need to set cookies for a request, use the `Request.cookies` parameter.

  A future version of Scrapy will include a new, better implementation of the reverted bug fix.

  (issue 4717, issue 4823)

Deprecation removals

- `scrapy.extensions.feedexport.S3FeedStorage` no longer reads the values of `access_key` and `secret_key` from the running project settings when they are not passed to its `__init__` method; you must either pass those parameters to its `__init__` method or use `S3FeedStorage.from_crawler` (issue 4356, issue 4411, issue 4688)
- `Rule.process_request` no longer admits callables which expect a single `request` parameter, rather than both `request` and `response` (issue 4818)

Deprecations

- In custom *media pipelines*, signatures that do not accept a keyword-only `item` parameter in any of the methods that *now support this parameter* are now deprecated (issue 4628, issue 4686)
- In custom *feed storage backend classes*, `__init__` method signatures that do not accept a keyword-only `feed_options` parameter are now deprecated (issue 547, issue 716, issue 4512)
- The `scrapy.utils.python.WeakKeyCache` class is now deprecated (issue 4684, issue 4701)
- The `scrapy.utils.boto.is_botocore()` function is now deprecated, use `scrapy.utils.boto.is_botocore_available()` instead (issue 4734, issue 4776)

New features

- The following methods of *media pipelines* now accept an `item` keyword-only parameter containing the source *item*:
  - In *scrapy.pipelines.files.FilesPipeline*:
    - `file_downloaded()`
    - *file_path()*
    - `media_downloaded()`
    - `media_to_download()`
  - In *scrapy.pipelines.images.ImagesPipeline*:
    - `file_downloaded()`
    - *file_path()*
    - `get_images()`
    - `image_downloaded()`
    - `media_downloaded()`
    - `media_to_download()`

  (issue 4628, issue 4686)
- The new `item_export_kwargs` key of the *FEEDS* setting allows to define keyword parameters to pass to *item exporter classes* (issue 4606, issue 4768)
- *Feed exports* gained overwrite support:
  - When using the *crawl* or *runspider* commands, you can use the `-O` option instead of `-o` to overwrite the output file
  - You can use the `overwrite` key in the *FEEDS* setting to configure whether to overwrite the output file (`True`) or append to its content (`False`)
  - The `__init__` and `from_crawler` methods of *feed storage backend classes* now receive a new keyword-only parameter, `feed_options`, which is a dictionary of *feed options*

  (issue 547, issue 716, issue 4512)
- Zstd-compressed responses are now supported if zstandard is installed (issue 4831)
- In settings, where the import path of a class is required, it is now possible to pass a class object instead (issue 3870, issue 3873).

  This includes also settings where only part of its value is made of an import path, such as *DOWNLOADER_MIDDLEWARES* or *DOWNLOAD_HANDLERS*.

- *Downloader middlewares* can now override `response.request`.

  If a *downloader middleware* returns a `Response` object from `process_response()` or `process_exception()` with a custom `Request` object assigned to `response.request`:

  - The response is handled by the callback of that custom `Request` object, instead of being handled by the callback of the original `Request` object
  - That custom `Request` object is now sent as the `request` argument to the `response_received` signal, instead of the original `Request` object

  (issue 4529, issue 4632)

- When using the *FTP feed storage backend*:

  - It is now possible to set the new `overwrite` *feed option* to `False` to append to an existing file instead of overwriting it
  - The FTP password can now be omitted if it is not necessary

  (issue 547, issue 716, issue 4512)

- The `__init__` method of `CsvItemExporter` now supports an `errors` parameter to indicate how to handle encoding errors (issue 4755)
- When *using asyncio*, it is now possible to *set a custom asyncio loop* (issue 4306, issue 4414)
- Serialized requests (see *Jobs: pausing and resuming crawls*) now support callbacks that are spider methods that delegate on other callable (issue 4756)
- When a response is larger than `DOWNLOAD_MAXSIZE`, the logged message is now a warning, instead of an error (issue 3874, issue 3886, issue 4752)

Bug fixes

- The `genspider` command no longer overwrites existing files unless the `--force` option is used (issue 4561, issue 4616, issue 4623)
- Cookies with an empty value are no longer considered invalid cookies (issue 4772)
- The `runspider` command now supports files with the `.pyw` file extension (issue 4643, issue 4646)
- The `HttpProxyMiddleware` middleware now simply ignores unsupported proxy values (issue 3331, issue 4778)
- Checks for generator callbacks with a `return` statement no longer warn about `return` statements in nested functions (issue 4720, issue 4721)
- The system file mode creation mask no longer affects the permissions of files generated using the `startproject` command (issue 4722)
- `scrapy.utils.iterators.xmliter()` now supports namespaced node names (issue 861, issue 4746)
- `Request` objects can now have `about:` URLs, which can work when using a headless browser (issue 4835)

Documentation

- The `FEED_URI_PARAMS` setting is now documented (issue 4671, issue 4724)
- Improved the documentation of *link extractors* with an usage example from a spider callback and reference documentation for the `Link` class (issue 4751, issue 4775)
- Clarified the impact of `CONCURRENT_REQUESTS` when using the `CloseSpider` extension (issue 4836)
- Removed references to Python 2's `unicode` type (issue 4547, issue 4703)
- We now have an *official deprecation policy* (issue 4705)

- Our *documentation policies* now cover usage of Sphinx's `versionadded` and `versionchanged` directives, and we have removed usages referencing Scrapy 1.4.0 and earlier versions (issue 3971, issue 4310)
- Other documentation cleanups (issue 4090, issue 4782, issue 4800, issue 4801, issue 4809, issue 4816, issue 4825)

Quality assurance

- Extended typing hints (issue 4243, issue 4691)
- Added tests for the *check* command (issue 4663)
- Fixed test failures on Debian (issue 4726, issue 4727, issue 4735)
- Improved Windows test coverage (issue 4723)
- Switched to formatted string literals where possible (issue 4307, issue 4324, issue 4672)
- Modernized `super()` usage (issue 4707)
- Other code and test cleanups (issue 1790, issue 3288, issue 4165, issue 4564, issue 4651, issue 4714, issue 4738, issue 4745, issue 4747, issue 4761, issue 4765, issue 4804, issue 4817, issue 4820, issue 4822, issue 4839)

7.1.22 Scrapy 2.3.0 (2020-08-04)

Highlights:

- *Feed exports* now support *Google Cloud Storage* as a storage backend
- The new *FEED_EXPORT_BATCH_ITEM_COUNT* setting allows to deliver output items in batches of up to the specified number of items.

  It also serves as a workaround for *delayed file delivery*, which causes Scrapy to only start item delivery after the crawl has finished when using certain storage backends (*S3*, *FTP*, and now *GCS*).
- The base implementation of *item loaders* has been moved into a separate library, itemloaders, allowing usage from outside Scrapy and a separate release schedule

Deprecation removals

- Removed the following classes and their parent modules from `scrapy.linkextractors`:
  - `htmlparser.HtmlParserLinkExtractor`
  - `regex.RegexLinkExtractor`
  - `sgml.BaseSgmlLinkExtractor`
  - `sgml.SgmlLinkExtractor`

  Use *LinkExtractor* instead (issue 4356, issue 4679)

Deprecations

- The `scrapy.utils.python.retry_on_eintr` function is now deprecated (issue 4683)

New features

- *Feed exports* support *Google Cloud Storage* (issue 685, issue 3608)
- New *FEED_EXPORT_BATCH_ITEM_COUNT* setting for batch deliveries (issue 4250, issue 4434)
- The *parse* command now allows specifying an output file (issue 4317, issue 4377)
- *Request.from_curl()* and *curl_to_request_kwargs()* now also support `--data-raw` (issue 4612)

- A `parse` callback may now be used in built-in spider subclasses, such as *`CrawlSpider`* (issue 712, issue 732, issue 781, issue 4254)

Bug fixes

- Fixed the *CSV exporting* of *dataclass items* and *attr.s items* (issue 4667, issue 4668)
- *`Request.from_curl()`* and *`curl_to_request_kwargs()`* now set the request method to `POST` when a request body is specified and no request method is specified (issue 4612)
- The processing of ANSI escape sequences in enabled in Windows 10.0.14393 and later, where it is required for colored output (issue 4393, issue 4403)

Documentation

- Updated the OpenSSL cipher list format link in the documentation about the *`DOWNLOADER_CLIENT_TLS_CIPHERS`* setting (issue 4653)
- Simplified the code example in *Working with dataclass items* (issue 4652)

Quality assurance

- The base implementation of *item loaders* has been moved into itemloaders (issue 4005, issue 4516)
- Fixed a silenced error in some scheduler tests (issue 4644, issue 4645)
- Renewed the localhost certificate used for SSL tests (issue 4650)
- Removed cookie-handling code specific to Python 2 (issue 4682)
- Stopped using Python 2 unicode literal syntax (issue 4704)
- Stopped using a backlash for line continuation (issue 4673)
- Removed unneeded entries from the MyPy exception list (issue 4690)
- Automated tests now pass on Windows as part of our continuous integration system (issue 4458)
- Automated tests now pass on the latest PyPy version for supported Python versions in our continuous integration system (issue 4504)

7.1.23 Scrapy 2.2.1 (2020-07-17)

- The *`startproject`* command no longer makes unintended changes to the permissions of files in the destination folder, such as removing execution permissions (issue 4662, issue 4666)

7.1.24 Scrapy 2.2.0 (2020-06-24)

Highlights:

- Python 3.5.2+ is required now
- *dataclass objects* and *attrs objects* are now valid *item types*
- New *`TextResponse.json`* method
- New *`bytes_received`* signal that allows canceling response download
- *`CookiesMiddleware`* fixes

Backward-incompatible changes

- Support for Python 3.5.0 and 3.5.1 has been dropped; Scrapy now refuses to run with a Python version lower than 3.5.2, which introduced `typing.Type` (issue 4615)

Deprecations

- `TextResponse.body_as_unicode()` is now deprecated, use *`TextResponse.text`* instead (issue 4546, issue 4555, issue 4579)
- `scrapy.item.BaseItem` is now deprecated, use *`scrapy.item.Item`* instead (issue 4534)

New features

- *dataclass objects* and *attrs objects* are now valid *item types*, and a new itemadapter library makes it easy to write code that *supports any item type* (issue 2749, issue 2807, issue 3761, issue 3881, issue 4642)
- A new *`TextResponse.json`* method allows to deserialize JSON responses (issue 2444, issue 4460, issue 4574)
- A new *`bytes_received`* signal allows monitoring response download progress and *stopping downloads* (issue 4205, issue 4559)
- The dictionaries in the result list of a *media pipeline* now include a new key, `status`, which indicates if the file was downloaded or, if the file was not downloaded, why it was not downloaded; see *`FilesPipeline.get_media_requests`* for more information (issue 2893, issue 4486)
- When using *Google Cloud Storage* for a *media pipeline*, a warning is now logged if the configured credentials do not grant the required permissions (issue 4346, issue 4508)
- *Link extractors* are now serializable, as long as you do not use lambdas for parameters; for example, you can now pass link extractors in *`Request.cb_kwargs`* or *`Request.meta`* when *persisting scheduled requests* (issue 4554)
- Upgraded the pickle protocol that Scrapy uses from protocol 2 to protocol 4, improving serialization capabilities and performance (issue 4135, issue 4541)
- `scrapy.utils.misc.create_instance()` now raises a `TypeError` exception if the resulting instance is `None` (issue 4528, issue 4532)

Bug fixes

- *`CookiesMiddleware`* no longer discards cookies defined in *`Request.headers`* (issue 1992, issue 2400)
- *`CookiesMiddleware`* no longer re-encodes cookies defined as `bytes` in the `cookies` parameter of the `__init__` method of *`Request`* (issue 2400, issue 3575)
- When *`FEEDS`* defines multiple URIs, *`FEED_STORE_EMPTY`* is `False` and the crawl yields no items, Scrapy no longer stops feed exports after the first URI (issue 4621, issue 4626)
- *`Spider`* callbacks defined using *coroutine syntax* no longer need to return an iterable, and may instead return a *`Request`* object, an *item*, or `None` (issue 4609)
- The *`startproject`* command now ensures that the generated project folders and files have the right permissions (issue 4604)
- Fix a `KeyError` exception being sometimes raised from `scrapy.utils.datatypes.LocalWeakReferencedCache` (issue 4597, issue 4599)
- When *`FEEDS`* defines multiple URIs, log messages about items being stored now contain information from the corresponding feed, instead of always containing information about only one of the feeds (issue 4619, issue 4629)

Documentation

- Added a new section about *accessing cb_kwargs from errbacks* (issue 4598, issue 4634)
- Covered chompjs in *Parsing JavaScript code* (issue 4556, issue 4562)
- Removed from *Coroutines* the warning about the API being experimental (issue 4511, issue 4513)
- Removed references to unsupported versions of Twisted (issue 4533)
- Updated the description of the *screenshot pipeline example*, which now uses *coroutine syntax* instead of returning a `Deferred` (issue 4514, issue 4593)
- Removed a misleading import line from the `scrapy.utils.log.configure_logging()` code example (issue 4510, issue 4587)
- The display-on-hover behavior of internal documentation references now also covers links to *commands*, `Request.meta` keys, *settings* and *signals* (issue 4495, issue 4563)
- It is again possible to download the documentation for offline reading (issue 4578, issue 4585)
- Removed backslashes preceding `*args` and `**kwargs` in some function and method signatures (issue 4592, issue 4596)

Quality assurance

- Adjusted the code base further to our *style guidelines* (issue 4237, issue 4525, issue 4538, issue 4539, issue 4540, issue 4542, issue 4543, issue 4544, issue 4545, issue 4557, issue 4558, issue 4566, issue 4568, issue 4572)
- Removed remnants of Python 2 support (issue 4550, issue 4553, issue 4568)
- Improved code sharing between the `crawl` and `runspider` commands (issue 4548, issue 4552)
- Replaced `chain(*iterable)` with `chain.from_iterable(iterable)` (issue 4635)
- You may now run the `asyncio` tests with Tox on any Python version (issue 4521)
- Updated test requirements to reflect an incompatibility with pytest 5.4 and 5.4.1 (issue 4588)
- Improved `SpiderLoader` test coverage for scenarios involving duplicate spider names (issue 4549, issue 4560)
- Configured Travis CI to also run the tests with Python 3.5.2 (issue 4518, issue 4615)
- Added a Pylint job to Travis CI (issue 3727)
- Added a Mypy job to Travis CI (issue 4637)
- Made use of set literals in tests (issue 4573)
- Cleaned up the Travis CI configuration (issue 4517, issue 4519, issue 4522, issue 4537)

7.1.25 Scrapy 2.1.0 (2020-04-24)

Highlights:

- New `FEEDS` setting to export to multiple feeds
- New `Response.ip_address` attribute

Backward-incompatible changes

- `AssertionError` exceptions triggered by assert statements have been replaced by new exception types, to support running Python in optimized mode (see `-O`) without changing Scrapy's behavior in any unexpected ways.

  If you catch an `AssertionError` exception from Scrapy, update your code to catch the corresponding new exception.

(issue 4440)

Deprecation removals

- The `LOG_UNSERIALIZABLE_REQUESTS` setting is no longer supported, use *`SCHEDULER_DEBUG`* instead (issue 4385)
- The `REDIRECT_MAX_METAREFRESH_DELAY` setting is no longer supported, use *`METAREFRESH_MAXDELAY`* instead (issue 4385)
- The `ChunkedTransferMiddleware` middleware has been removed, including the entire `scrapy.downloadermiddlewares.chunked` module; chunked transfers work out of the box (issue 4431)
- The `spiders` property has been removed from *`Crawler`*, use `CrawlerRunner.spider_loader` or instantiate *`SPIDER_LOADER_CLASS`* with your settings instead (issue 4398)
- The `MultiValueDict`, `MultiValueDictKeyError`, and `SiteNode` classes have been removed from `scrapy.utils.datatypes` (issue 4400)

Deprecations

- The `FEED_FORMAT` and `FEED_URI` settings have been deprecated in favor of the new *`FEEDS`* setting (issue 1336, issue 3858, issue 4507)

New features

- A new setting, *`FEEDS`*, allows configuring multiple output feeds with different settings each (issue 1336, issue 3858, issue 4507)
- The *`crawl`* and *`runspider`* commands now support multiple `-o` parameters (issue 1336, issue 3858, issue 4507)
- The *`crawl`* and *`runspider`* commands now support specifying an output format by appending `:<format>` to the output file (issue 1336, issue 3858, issue 4507)
- The new *`Response.ip_address`* attribute gives access to the IP address that originated a response (issue 3903, issue 3940)
- A warning is now issued when a value in `allowed_domains` includes a port (issue 50, issue 3198, issue 4413)
- Zsh completion now excludes used option aliases from the completion list (issue 4438)

Bug fixes

- *Request serialization* no longer breaks for callbacks that are spider attributes which are assigned a function with a different name (issue 4500)
- `None` values in `allowed_domains` no longer cause a `TypeError` exception (issue 4410)
- Zsh completion no longer allows options after arguments (issue 4438)
- zope.interface 5.0.0 and later versions are now supported (issue 4447, issue 4448)
- `Spider.make_requests_from_url`, deprecated in Scrapy 1.4.0, now issues a warning when used (issue 4412)

Documentation

- Improved the documentation about signals that allow their handlers to return a `Deferred` (issue 4295, issue 4390)
- Our PyPI entry now includes links for our documentation, our source code repository and our issue tracker (issue 4456)
- Covered the curl2scrapy service in the documentation (issue 4206, issue 4455)

- Removed references to the Guppy library, which only works in Python 2 (issue 4285, issue 4343)
- Extended use of InterSphinx to link to Python 3 documentation (issue 4444, issue 4445)
- Added support for Sphinx 3.0 and later (issue 4475, issue 4480, issue 4496, issue 4503)

Quality assurance

- Removed warnings about using old, removed settings (issue 4404)
- Removed a warning about importing `StringTransport` from `twisted.test.proto_helpers` in Twisted 19.7.0 or newer (issue 4409)
- Removed outdated Debian package build files (issue 4384)
- Removed `object` usage as a base class (issue 4430)
- Removed code that added support for old versions of Twisted that we no longer support (issue 4472)
- Fixed code style issues (issue 4468, issue 4469, issue 4471, issue 4481)
- Removed `twisted.internet.defer.returnValue()` calls (issue 4443, issue 4446, issue 4489)

7.1.26 Scrapy 2.0.1 (2020-03-18)

- *`Response.follow_all`* now supports an empty URL iterable as input (issue 4408, issue 4420)
- Removed top-level `reactor` imports to prevent errors about the wrong Twisted reactor being installed when setting a different Twisted reactor using *`TWISTED_REACTOR`* (issue 4401, issue 4406)
- Fixed tests (issue 4422)

7.1.27 Scrapy 2.0.0 (2020-03-03)

Highlights:

- Python 2 support has been removed
- *Partial* coroutine syntax support and *experimental* `asyncio` support
- New *`Response.follow_all`* method
- *FTP support* for media pipelines
- New *`Response.certificate`* attribute
- IPv6 support through *`DNS_RESOLVER`*

Backward-incompatible changes

- Python 2 support has been removed, following Python 2 end-of-life on January 1, 2020 (issue 4091, issue 4114, issue 4115, issue 4121, issue 4138, issue 4231, issue 4242, issue 4304, issue 4309, issue 4373)
- Retry gaveups (see *`RETRY_TIMES`*) are now logged as errors instead of as debug information (issue 3171, issue 3566)
- File extensions that *`LinkExtractor`* ignores by default now also include `7z`, `7zip`, `apk`, `bz2`, `cdr`, `dmg`, `ico`, `iso`, `tar`, `tar.gz`, `webm`, and `xz` (issue 1837, issue 2067, issue 4066)
- The *`METAREFRESH_IGNORE_TAGS`* setting is now an empty list by default, following web browser behavior (issue 3844, issue 4311)
- The *`HttpCompressionMiddleware`* now includes spaces after commas in the value of the `Accept-Encoding` header that it sets, following web browser behavior (issue 4293)

- The `__init__` method of custom download handlers (see *DOWNLOAD_HANDLERS*) or subclasses of the following downloader handlers no longer receives a `settings` parameter:
  - `scrapy.core.downloader.handlers.datauri.DataURIDownloadHandler`
  - `scrapy.core.downloader.handlers.file.FileDownloadHandler`

  Use the `from_settings` or `from_crawler` class methods to expose such a parameter to your custom download handlers.

  (issue 4126)
- We have refactored the *scrapy.core.scheduler.Scheduler* class and related queue classes (see *SCHEDULER_PRIORITY_QUEUE*, *SCHEDULER_DISK_QUEUE* and *SCHEDULER_MEMORY_QUEUE*) to make it easier to implement custom scheduler queue classes. See *Changes to scheduler queue classes* below for details.
- Overridden settings are now logged in a different format. This is more in line with similar information logged at startup (issue 4199)

Deprecation removals

- The *Scrapy shell* no longer provides a *sel* proxy object, use *response.selector* instead (issue 4347)
- LevelDB support has been removed (issue 4112)
- The following functions have been removed from `scrapy.utils.python`: `isbinarytext`, `is_writable`, `setattr_default`, `stringify_dict` (issue 4362)

Deprecations

- Using environment variables prefixed with `SCRAPY_` to override settings is deprecated (issue 4300, issue 4374, issue 4375)
- `scrapy.linkextractors.FilteringLinkExtractor` is deprecated, use *scrapy.linkextractors.LinkExtractor* instead (issue 4045)
- The `noconnect` query string argument of proxy URLs is deprecated and should be removed from proxy URLs (issue 4198)
- The `next` method of `scrapy.utils.python.MutableChain` is deprecated, use the global `next()` function or `MutableChain.__next__` instead (issue 4153)

New features

- Added *partial support* for Python's coroutine syntax and *experimental support* for `asyncio` and `asyncio`-powered libraries (issue 4010, issue 4259, issue 4269, issue 4270, issue 4271, issue 4316, issue 4318)
- The new *Response.follow_all* method offers the same functionality as *Response.follow* but supports an iterable of URLs as input and returns an iterable of requests (issue 2582, issue 4057, issue 4286)
- *Media pipelines* now support *FTP storage* (issue 3928, issue 3961)
- The new *Response.certificate* attribute exposes the SSL certificate of the server as a `twisted.internet.ssl.Certificate` object for HTTPS responses (issue 2726, issue 4054)
- A new *DNS_RESOLVER* setting allows enabling IPv6 support (issue 1031, issue 4227)
- A new *SCRAPER_SLOT_MAX_ACTIVE_SIZE* setting allows configuring the existing soft limit that pauses request downloads when the total response data being processed is too high (issue 1410, issue 3551)
- A new *TWISTED_REACTOR* setting allows customizing the `reactor` that Scrapy uses, allowing to *enable asyncio support* or deal with a *common macOS issue* (issue 2905, issue 4294)

- Scheduler disk and memory queues may now use the class methods `from_crawler` or `from_settings` (issue 3884)
- The new *Response.cb_kwargs* attribute serves as a shortcut for *Response.request.cb_kwargs* (issue 4331)
- *Response.follow* now supports a `flags` parameter, for consistency with *Request* (issue 4277, issue 4279)
- *Item loader processors* can now be regular functions, they no longer need to be methods (issue 3899)
- *Rule* now accepts an `errback` parameter (issue 4000)
- *Request* no longer requires a `callback` parameter when an `errback` parameter is specified (issue 3586, issue 4008)
- *LogFormatter* now supports some additional methods:
  - *download_error* for download errors
  - *item_error* for exceptions raised during item processing by *item pipelines*
  - *spider_error* for exceptions raised from *spider callbacks*

  (issue 374, issue 3986, issue 3989, issue 4176, issue 4188)
- The `FEED_URI` setting now supports `pathlib.Path` values (issue 3731, issue 4074)
- A new *request_left_downloader* signal is sent when a request leaves the downloader (issue 4303)
- Scrapy logs a warning when it detects a request callback or errback that uses `yield` but also returns a value, since the returned value would be lost (issue 3484, issue 3869)
- *Spider* objects now raise an `AttributeError` exception if they do not have a `start_urls` attribute nor reimplement `scrapy.spiders.Spider.start_requests()`, but have a `start_url` attribute (issue 4133, issue 4170)
- *BaseItemExporter* subclasses may now use `super().__init__(**kwargs)` instead of `self._configure(kwargs)` in their `__init__` method, passing `dont_fail=True` to the parent `__init__` method if needed, and accessing `kwargs` at `self._kwargs` after calling their parent `__init__` method (issue 4193, issue 4370)
- A new `keep_fragments` parameter of `scrapy.utils.request.request_fingerprint` allows to generate different fingerprints for requests with different fragments in their URL (issue 4104)
- Download handlers (see *DOWNLOAD_HANDLERS*) may now use the `from_settings` and `from_crawler` class methods that other Scrapy components already supported (issue 4126)
- `scrapy.utils.python.MutableChain.__iter__` now returns `self`, allowing it to be used as a sequence (issue 4153)

Bug fixes

- The *crawl* command now also exits with exit code 1 when an exception happens before the crawling starts (issue 4175, issue 4207)
- *LinkExtractor.extract_links* no longer re-encodes the query string or URLs from non-UTF-8 responses in UTF-8 (issue 998, issue 1403, issue 1949, issue 4321)
- The first spider middleware (see *SPIDER_MIDDLEWARES*) now also processes exceptions raised from callbacks that are generators (issue 4260, issue 4272)
- Redirects to URLs starting with 3 slashes (`///`) are now supported (issue 4032, issue 4042)
- *Request* no longer accepts strings as `url` simply because they have a colon (issue 2552, issue 4094)
- The correct encoding is now used for attach names in *MailSender* (issue 4229, issue 4239)

- *RFPDupeFilter*, the default *DUPEFILTER_CLASS*, no longer writes an extra `\r` character on each line in Windows, which made the size of the `requests.seen` file unnecessarily large on that platform (issue 4283)
- Z shell auto-completion now looks for `.html` files, not `.http` files, and covers the `-h` command-line switch (issue 4122, issue 4291)
- Adding items to a `scrapy.utils.datatypes.LocalCache` object without a `limit` defined no longer raises a `TypeError` exception (issue 4123)
- Fixed a typo in the message of the `ValueError` exception raised when `scrapy.utils.misc.create_instance()` gets both `settings` and `crawler` set to `None` (issue 4128)

Documentation

- API documentation now links to an online, syntax-highlighted view of the corresponding source code (issue 4148)
- Links to unexisting documentation pages now allow access to the sidebar (issue 4152, issue 4169)
- Cross-references within our documentation now display a tooltip when hovered (issue 4173, issue 4183)
- Improved the documentation about *LinkExtractor.extract_links* and simplified *Link Extractors* (issue 4045)
- Clarified how *ItemLoader.item* works (issue 3574, issue 4099)
- Clarified that `logging.basicConfig()` should not be used when also using *CrawlerProcess* (issue 2149, issue 2352, issue 3146, issue 3960)
- Clarified the requirements for *Request* objects *when using persistence* (issue 4124, issue 4139)
- Clarified how to install a *custom image pipeline* (issue 4034, issue 4252)
- Fixed the signatures of the `file_path` method in *media pipeline* examples (issue 4290)
- Covered a backward-incompatible change in Scrapy 1.7.0 affecting custom *scrapy.core.scheduler.Scheduler* subclasses (issue 4274)
- Improved the `README.rst` and `CODE_OF_CONDUCT.md` files (issue 4059)
- Documentation examples are now checked as part of our test suite and we have fixed some of the issues detected (issue 4142, issue 4146, issue 4171, issue 4184, issue 4190)
- Fixed logic issues, broken links and typos (issue 4247, issue 4258, issue 4282, issue 4288, issue 4305, issue 4308, issue 4323, issue 4338, issue 4359, issue 4361)
- Improved consistency when referring to the `__init__` method of an object (issue 4086, issue 4088)
- Fixed an inconsistency between code and output in *Scrapy at a glance* (issue 4213)
- Extended `intersphinx` usage (issue 4147, issue 4172, issue 4185, issue 4194, issue 4197)
- We now use a recent version of Python to build the documentation (issue 4140, issue 4249)
- Cleaned up documentation (issue 4143, issue 4275)

Quality assurance

- Re-enabled proxy `CONNECT` tests (issue 2545, issue 4114)
- Added Bandit security checks to our test suite (issue 4162, issue 4181)
- Added Flake8 style checks to our test suite and applied many of the corresponding changes (issue 3944, issue 3945, issue 4137, issue 4157, issue 4167, issue 4174, issue 4186, issue 4195, issue 4238, issue 4246, issue 4355, issue 4360, issue 4365)

- Improved test coverage (issue 4097, issue 4218, issue 4236)
- Started reporting slowest tests, and improved the performance of some of them (issue 4163, issue 4164)
- Fixed broken tests and refactored some tests (issue 4014, issue 4095, issue 4244, issue 4268, issue 4372)
- Modified the tox configuration to allow running tests with any Python version, run Bandit and Flake8 tests by default, and enforce a minimum tox version programmatically (issue 4179)
- Cleaned up code (issue 3937, issue 4208, issue 4209, issue 4210, issue 4212, issue 4369, issue 4376, issue 4378)

Changes to scheduler queue classes

The following changes may impact any custom queue classes of all types:

- The `push` method no longer receives a second positional parameter containing `request.priority * -1`. If you need that value, get it from the first positional parameter, `request`, instead, or use the new `priority()` method in `scrapy.core.scheduler.ScrapyPriorityQueue` subclasses.

The following changes may impact custom priority queue classes:

- In the `__init__` method or the `from_crawler` or `from_settings` class methods:
  - The parameter that used to contain a factory function, `qfactory`, is now passed as a keyword parameter named `downstream_queue_cls`.
  - A new keyword parameter has been added: `key`. It is a string that is always an empty string for memory queues and indicates the `JOB_DIR` value for disk queues.
  - The parameter for disk queues that contains data from the previous crawl, `startprios` or `slot_startprios`, is now passed as a keyword parameter named `startprios`.
  - The `serialize` parameter is no longer passed. The disk queue class must take care of request serialization on its own before writing to disk, using the `request_to_dict()` and `request_from_dict()` functions from the `scrapy.utils.reqser` module.

The following changes may impact custom disk and memory queue classes:

- The signature of the `__init__` method is now `__init__(self, crawler, key)`.

The following changes affect specifically the `ScrapyPriorityQueue` and `DownloaderAwarePriorityQueue` classes from *`scrapy.core.scheduler`* and may affect subclasses:

- In the `__init__` method, most of the changes described above apply.

  `__init__` may still receive all parameters as positional parameters, however:
  - `downstream_queue_cls`, which replaced `qfactory`, must be instantiated differently.

    `qfactory` was instantiated with a priority value (integer).

    Instances of `downstream_queue_cls` should be created using the new `ScrapyPriorityQueue.qfactory` or `DownloaderAwarePriorityQueue.pqfactory` methods.
  - The new `key` parameter displaced the `startprios` parameter 1 position to the right.
- The following class attributes have been added:
  - `crawler`
  - `downstream_queue_cls` (details above)
  - `key` (details above)
- The `serialize` attribute has been removed (details above)

The following changes affect specifically the `ScrapyPriorityQueue` class and may affect subclasses:

- A new `priority()` method has been added which, given a request, returns `request.priority * -1`.

  It is used in `push()` to make up for the removal of its `priority` parameter.

- The `spider` attribute has been removed. Use `crawler.spider` instead.

The following changes affect specifically the `DownloaderAwarePriorityQueue` class and may affect subclasses:

- A new `pqueues` attribute offers a mapping of downloader slot names to the corresponding instances of `downstream_queue_cls`.

(issue 3884)

7.1.28 Scrapy 1.8.4 (2024-02-14)

Security bug fixes:

- Due to its ReDoS vulnerabilities, `scrapy.utils.iterators.xmliter` is now deprecated in favor of *xmliter_lxml()*, which *XMLFeedSpider* now uses.

  To minimize the impact of this change on existing code, *xmliter_lxml()* now supports indicating the node namespace as a prefix in the node name, and big files with highly nested trees when using libxml2 2.7+.

  Please, see the cc65-xxvf-f7r9 security advisory for more information.

- *DOWNLOAD_MAXSIZE* and *DOWNLOAD_WARNSIZE* now also apply to the decompressed response body. Please, see the 7j7m-v7m3-jqm7 security advisory for more information.

- Also in relation with the 7j7m-v7m3-jqm7 security advisory, use of the `scrapy.downloadermiddlewares.decompression` module is discouraged and will trigger a warning.

- The `Authorization` header is now dropped on redirects to a different domain. Please, see the cw9j-q3vf-hrrv security advisory for more information.

7.1.29 Scrapy 1.8.3 (2022-07-25)

Security bug fix:

- When *HttpProxyMiddleware* processes a request with *proxy* metadata, and that *proxy* metadata includes proxy credentials, *HttpProxyMiddleware* sets the `Proxy-Authorization` header, but only if that header is not already set.

  There are third-party proxy-rotation downloader middlewares that set different *proxy* metadata every time they process a request.

  Because of request retries and redirects, the same request can be processed by downloader middlewares more than once, including both *HttpProxyMiddleware* and any third-party proxy-rotation downloader middleware.

  These third-party proxy-rotation downloader middlewares could change the *proxy* metadata of a request to a new value, but fail to remove the `Proxy-Authorization` header from the previous value of the *proxy* metadata, causing the credentials of one proxy to be sent to a different proxy.

  To prevent the unintended leaking of proxy credentials, the behavior of *HttpProxyMiddleware* is now as follows when processing a request:

  - If the request being processed defines *proxy* metadata that includes credentials, the `Proxy-Authorization` header is always updated to feature those credentials.
  - If the request being processed defines *proxy* metadata without credentials, the `Proxy-Authorization` header is removed *unless* it was originally defined for the same proxy URL.

    To remove proxy credentials while keeping the same proxy URL, remove the `Proxy-Authorization` header.

  - If the request has no *proxy* metadata, or that metadata is a falsy value (e.g. `None`), the `Proxy-Authorization` header is removed.

    It is no longer possible to set a proxy URL through the *proxy* metadata but set the credentials through the `Proxy-Authorization` header. Set proxy credentials through the *proxy* metadata instead.

7.1.30 Scrapy 1.8.2 (2022-03-01)

Security bug fixes:

- When a *Request* object with cookies defined gets a redirect response causing a new *Request* object to be scheduled, the cookies defined in the original *Request* object are no longer copied into the new *Request* object.

  If you manually set the `Cookie` header on a *Request* object and the domain name of the redirect URL is not an exact match for the domain of the URL of the original *Request* object, your `Cookie` header is now dropped from the new *Request* object.

  The old behavior could be exploited by an attacker to gain access to your cookies. Please, see the cjvr-mfj7-j4j8 security advisory for more information.

  > **Note**
  >
  > It is still possible to enable the sharing of cookies between different domains with a shared domain suffix (e.g. `example.com` and any subdomain) by defining the shared domain suffix (e.g. `example.com`) as the cookie domain when defining your cookies. See the documentation of the *Request* class for more information.

- When the domain of a cookie, either received in the `Set-Cookie` header of a response or defined in a *Request* object, is set to a public suffix, the cookie is now ignored unless the cookie domain is the same as the request domain.

  The old behavior could be exploited by an attacker to inject cookies into your requests to some other domains. Please, see the mfjm-vh54-3f96 security advisory for more information.

7.1.31 Scrapy 1.8.1 (2021-10-05)

- **Security bug fix:**

  If you use *HttpAuthMiddleware* (i.e. the `http_user` and `http_pass` spider attributes) for HTTP authentication, any request exposes your credentials to the request target.

  To prevent unintended exposure of authentication credentials to unintended domains, you must now additionally set a new, additional spider attribute, `http_auth_domain`, and point it to the specific domain to which the authentication credentials must be sent.

  If the `http_auth_domain` spider attribute is not set, the domain of the first request will be considered the HTTP authentication target, and authentication credentials will only be sent in requests targeting that domain.

  If you need to send the same HTTP authentication credentials to multiple domains, you can use `w3lib.http.basic_auth_header()` instead to set the value of the `Authorization` header of your requests.

  If you *really* want your spider to send the same HTTP authentication credentials to any domain, set the `http_auth_domain` spider attribute to `None`.

  Finally, if you are a user of scrapy-splash, know that this version of Scrapy breaks compatibility with scrapy-splash 0.7.2 and earlier. You will need to upgrade scrapy-splash to a greater version for it to continue to work.

7.1.32 Scrapy 1.8.0 (2019-10-28)

Highlights:

- Dropped Python 3.4 support and updated minimum requirements; made Python 3.8 support official
- New *Request.from_curl()* class method
- New *ROBOTSTXT_PARSER* and *ROBOTSTXT_USER_AGENT* settings
- New *DOWNLOADER_CLIENT_TLS_CIPHERS* and *DOWNLOADER_CLIENT_TLS_VERBOSE_LOGGING* settings

Backward-incompatible changes

- Python 3.4 is no longer supported, and some of the minimum requirements of Scrapy have also changed:
  - cssselect 0.9.1
  - cryptography 2.0
  - lxml 3.5.0
  - pyOpenSSL 16.2.0
  - queuelib 1.4.2
  - service_identity 16.0.0
  - six 1.10.0
  - Twisted 17.9.0 (16.0.0 with Python 2)
  - zope.interface 4.1.3

  (issue 3892)
- `JSONRequest` is now called *JsonRequest* for consistency with similar classes (issue 3929, issue 3982)
- If you are using a custom context factory (*DOWNLOADER_CLIENTCONTEXTFACTORY*), its `__init__` method must accept two new parameters: `tls_verbose_logging` and `tls_ciphers` (issue 2111, issue 3392, issue 3442, issue 3450)
- *ItemLoader* now turns the values of its input item into lists:

  ```
  >>> item = MyItem()
  >>> item["field"] = "value1"
  >>> loader = ItemLoader(item=item)
  >>> item["field"]
  ['value1']
  ```

  This is needed to allow adding values to existing fields (`loader.add_value('field', 'value2')`).

  (issue 3804, issue 3819, issue 3897, issue 3976, issue 3998, issue 4036)

See also *Deprecation removals* below.

New features

- A new *Request.from_curl* class method allows *creating a request from a cURL command* (issue 2985, issue 3862)
- A new *ROBOTSTXT_PARSER* setting allows choosing which robots.txt parser to use. It includes built-in support for *RobotFileParser*, *Protego* (default), Reppy, and *Robotexclusionrulesparser*, and allows you to *implement support for additional parsers* (issue 754, issue 2669, issue 3796, issue 3935, issue 3969, issue 4006)

- A new *ROBOTSTXT_USER_AGENT* setting allows defining a separate user agent string to use for robots.txt parsing (issue 3931, issue 3966)
- *Rule* no longer requires a *LinkExtractor* parameter (issue 781, issue 4016)
- Use the new *DOWNLOADER_CLIENT_TLS_CIPHERS* setting to customize the TLS/SSL ciphers used by the default HTTP/1.1 downloader (issue 3392, issue 3442)
- Set the new *DOWNLOADER_CLIENT_TLS_VERBOSE_LOGGING* setting to `True` to enable debug-level messages about TLS connection parameters after establishing HTTPS connections (issue 2111, issue 3450)
- Callbacks that receive keyword arguments (see *Request.cb_kwargs*) can now be tested using the new *@cb_kwargs spider contract* (issue 3985, issue 3988)
- When a *@scrapes* spider contract fails, all missing fields are now reported (issue 766, issue 3939)
- *Custom log formats* can now drop messages by having the corresponding methods of the configured *LOG_FORMATTER* return `None` (issue 3984, issue 3987)
- A much improved completion definition is now available for Zsh (issue 4069)

Bug fixes

- *ItemLoader.load_item()* no longer makes later calls to *ItemLoader.get_output_value()* or *ItemLoader.load_item()* return empty data (issue 3804, issue 3819, issue 3897, issue 3976, issue 3998, issue 4036)
- Fixed *DummyStatsCollector* raising a `TypeError` exception (issue 4007, issue 4052)
- *FilesPipeline.file_path* and *ImagesPipeline.file_path* no longer choose file extensions that are not registered with IANA (issue 1287, issue 3953, issue 3954)
- When using botocore to persist files in S3, all botocore-supported headers are properly mapped now (issue 3904, issue 3905)
- FTP passwords in `FEED_URI` containing percent-escaped characters are now properly decoded (issue 3941)
- A memory-handling and error-handling issue in `scrapy.utils.ssl.get_temp_key_info()` has been fixed (issue 3920)

Documentation

- The documentation now covers how to define and configure a *custom log format* (issue 3616, issue 3660)
- API documentation added for *MarshalItemExporter* and *PythonItemExporter* (issue 3973)
- API documentation added for `BaseItem` and *ItemMeta* (issue 3999)
- Minor documentation fixes (issue 2998, issue 3398, issue 3597, issue 3894, issue 3934, issue 3978, issue 3993, issue 4022, issue 4028, issue 4033, issue 4046, issue 4050, issue 4055, issue 4056, issue 4061, issue 4072, issue 4071, issue 4079, issue 4081, issue 4089, issue 4093)

Deprecation removals

- `scrapy.xlib` has been removed (issue 4015)

Deprecations

- The LevelDB storage backend (`scrapy.extensions.httpcache.LeveldbCacheStorage`) of *HttpCacheMiddleware* is deprecated (issue 4085, issue 4092)
- Use of the undocumented `SCRAPY_PICKLED_SETTINGS_TO_OVERRIDE` environment variable is deprecated (issue 3910)

- `scrapy.item.DictItem` is deprecated, use *Item* instead (issue 3999)

Other changes

- Minimum versions of optional Scrapy requirements that are covered by continuous integration tests have been updated:
  - botocore 1.3.23
  - Pillow 3.4.2

  Lower versions of these optional requirements may work, but it is not guaranteed (issue 3892)
- GitHub templates for bug reports and feature requests (issue 3126, issue 3471, issue 3749, issue 3754)
- Continuous integration fixes (issue 3923)
- Code cleanup (issue 3391, issue 3907, issue 3946, issue 3950, issue 4023, issue 4031)

7.1.33 Scrapy 1.7.4 (2019-10-21)

Revert the fix for issue 3804 (issue 3819), which has a few undesired side effects (issue 3897, issue 3976).

As a result, when an item loader is initialized with an item, *ItemLoader.load_item()* once again makes later calls to *ItemLoader.get_output_value()* or *ItemLoader.load_item()* return empty data.

7.1.34 Scrapy 1.7.3 (2019-08-01)

Enforce lxml 4.3.5 or lower for Python 3.4 (issue 3912, issue 3918).

7.1.35 Scrapy 1.7.2 (2019-07-23)

Fix Python 2 support (issue 3889, issue 3893, issue 3896).

7.1.36 Scrapy 1.7.1 (2019-07-18)

Re-packaging of Scrapy 1.7.0, which was missing some changes in PyPI.

7.1.37 Scrapy 1.7.0 (2019-07-18)

> **Note**
>
> Make sure you install Scrapy 1.7.1. The Scrapy 1.7.0 package in PyPI is the result of an erroneous commit tagging and does not include all the changes described below.

Highlights:

- Improvements for crawls targeting multiple domains
- A cleaner way to pass arguments to callbacks
- A new class for JSON requests
- Improvements for rule-based spiders
- New features for feed exports

Backward-incompatible changes

- `429` is now part of the *RETRY_HTTP_CODES* setting by default

  This change is **backward incompatible**. If you don't want to retry `429`, you must override *RETRY_HTTP_CODES* accordingly.

- *Crawler*, *CrawlerRunner.crawl* and *CrawlerRunner.create_crawler* no longer accept a *Spider* subclass instance, they only accept a *Spider* subclass now.

  Spider subclass instances were never meant to work, and they were not working as one would expect: instead of using the passed *Spider* subclass instance, their `from_crawler` method was called to generate a new instance.

- Non-default values for the *SCHEDULER_PRIORITY_QUEUE* setting may stop working. Scheduler priority queue classes now need to handle *Request* objects instead of arbitrary Python data structures.

- An additional `crawler` parameter has been added to the `__init__` method of the *Scheduler* class. Custom scheduler subclasses which don't accept arbitrary parameters in their `__init__` method might break because of this change.

  For more information, see *SCHEDULER*.

See also *Deprecation removals* below.

New features

- A new scheduler priority queue, `scrapy.pqueues.DownloaderAwarePriorityQueue`, may be *enabled* for a significant scheduling improvement on crawls targeting multiple web domains, at the cost of no *CONCURRENT_REQUESTS_PER_IP* support (issue 3520)
- A new *Request.cb_kwargs* attribute provides a cleaner way to pass keyword arguments to callback methods (issue 1138, issue 3563)
- A new *JSONRequest* class offers a more convenient way to build JSON requests (issue 3504, issue 3505)
- A `process_request` callback passed to the *Rule* `__init__` method now receives the *Response* object that originated the request as its second argument (issue 3682)
- A new `restrict_text` parameter for the *LinkExtractor* `__init__` method allows filtering links by linking text (issue 3622, issue 3635)
- A new *FEED_STORAGE_S3_ACL* setting allows defining a custom ACL for feeds exported to Amazon S3 (issue 3607)
- A new *FEED_STORAGE_FTP_ACTIVE* setting allows using FTP's active connection mode for feeds exported to FTP servers (issue 3829)
- A new *METAREFRESH_IGNORE_TAGS* setting allows overriding which HTML tags are ignored when searching a response for HTML meta tags that trigger a redirect (issue 1422, issue 3768)
- A new *redirect_reasons* request meta key exposes the reason (status code, meta refresh) behind every followed redirect (issue 3581, issue 3687)
- The `SCRAPY_CHECK` variable is now set to the `true` string during runs of the *check* command, which allows *detecting contract check runs from code* (issue 3704, issue 3739)
- A new `Item.deepcopy()` method makes it easier to *deep-copy items* (issue 1493, issue 3671)
- *CoreStats* also logs `elapsed_time_seconds` now (issue 3638)
- Exceptions from *ItemLoader input and output processors* are now more verbose (issue 3836, issue 3840)
- *Crawler*, *CrawlerRunner.crawl* and *CrawlerRunner.create_crawler* now fail gracefully if they receive a *Spider* subclass instance instead of the subclass itself (issue 2283, issue 3610, issue 3872)

Bug fixes

- *process_spider_exception()* is now also invoked for generators (issue 220, issue 2061)
- System exceptions like KeyboardInterrupt are no longer caught (issue 3726)
- *ItemLoader.load_item()* no longer makes later calls to *ItemLoader.get_output_value()* or *ItemLoader.load_item()* return empty data (issue 3804, issue 3819)
- The images pipeline (*ImagesPipeline*) no longer ignores these Amazon S3 settings: *AWS_ENDPOINT_URL*, *AWS_REGION_NAME*, *AWS_USE_SSL*, *AWS_VERIFY* (issue 3625)
- Fixed a memory leak in `scrapy.pipelines.media.MediaPipeline` affecting, for example, non-200 responses and exceptions from custom middlewares (issue 3813)
- Requests with private callbacks are now correctly unserialized from disk (issue 3790)
- *FormRequest.from_response()* now handles invalid methods like major web browsers (issue 3777, issue 3794)

Documentation

- A new topic, *Selecting dynamically-loaded content*, covers recommended approaches to read dynamically-loaded data (issue 3703)
- *Broad Crawls* now features information about memory usage (issue 1264, issue 3866)
- The documentation of *Rule* now covers how to access the text of a link when using *CrawlSpider* (issue 3711, issue 3712)
- A new section, *Writing your own storage backend*, covers writing a custom cache storage backend for *HttpCacheMiddleware* (issue 3683, issue 3692)
- A new *FAQ* entry, *How to split an item into multiple items in an item pipeline?*, explains what to do when you want to split an item into multiple items from an item pipeline (issue 2240, issue 3672)
- Updated the *FAQ entry about crawl order* to explain why the first few requests rarely follow the desired order (issue 1739, issue 3621)
- The *LOGSTATS_INTERVAL* setting (issue 3730), the *FilesPipeline.file_path* and *ImagesPipeline.file_path* methods (issue 2253, issue 3609) and the *Crawler.stop()* method (issue 3842) are now documented
- Some parts of the documentation that were confusing or misleading are now clearer (issue 1347, issue 1789, issue 2289, issue 3069, issue 3615, issue 3626, issue 3668, issue 3670, issue 3673, issue 3728, issue 3762, issue 3861, issue 3882)
- Minor documentation fixes (issue 3648, issue 3649, issue 3662, issue 3674, issue 3676, issue 3694, issue 3724, issue 3764, issue 3767, issue 3791, issue 3797, issue 3806, issue 3812)

Deprecation removals

The following deprecated APIs have been removed (issue 3578):

- `scrapy.conf` (use *Crawler.settings*)
- From `scrapy.core.downloader.handlers`:
  - `http.HttpDownloadHandler` (use `http10.HTTP10DownloadHandler`)
- `scrapy.loader.ItemLoader._get_values` (use `_get_xpathvalues`)
- `scrapy.loader.XPathItemLoader` (use *ItemLoader*)
- `scrapy.log` (see *Logging*)

- From `scrapy.pipelines`:
  - `files.FilesPipeline.file_key` (use `file_path`)
  - `images.ImagesPipeline.file_key` (use `file_path`)
  - `images.ImagesPipeline.image_key` (use `file_path`)
  - `images.ImagesPipeline.thumb_key` (use `thumb_path`)
- From both `scrapy.selector` and `scrapy.selector.lxmlsel`:
  - `HtmlXPathSelector` (use *Selector*)
  - `XmlXPathSelector` (use *Selector*)
  - `XPathSelector` (use *Selector*)
  - `XPathSelectorList` (use *Selector*)
- From `scrapy.selector.csstranslator`:
  - `ScrapyGenericTranslator` (use parsel.csstranslator.GenericTranslator)
  - `ScrapyHTMLTranslator` (use parsel.csstranslator.HTMLTranslator)
  - `ScrapyXPathExpr` (use parsel.csstranslator.XPathExpr)
- From *Selector*:
  - `_root` (both the `__init__` method argument and the object property, use `root`)
  - `extract_unquoted` (use `getall`)
  - `select` (use `xpath`)
- From *SelectorList*:
  - `extract_unquoted` (use `getall`)
  - `select` (use `xpath`)
  - `x` (use `xpath`)
- `scrapy.spiders.BaseSpider` (use *Spider*)
- From *Spider* (and subclasses):
  - `DOWNLOAD_DELAY` (use *download_delay*)
  - `set_crawler` (use `from_crawler()`)
- `scrapy.spiders.spiders` (use *SpiderLoader*)
- `scrapy.telnet` (use *scrapy.extensions.telnet*)
- From `scrapy.utils.python`:
  - `str_to_unicode` (use `to_unicode`)
  - `unicode_to_str` (use `to_bytes`)
- `scrapy.utils.response.body_or_str`

The following deprecated settings have also been removed (issue 3578):

- `SPIDER_MANAGER_CLASS` (use *SPIDER_LOADER_CLASS*)

Deprecations

- The `queuelib.PriorityQueue` value for the *SCHEDULER_PRIORITY_QUEUE* setting is deprecated. Use `scrapy.pqueues.ScrapyPriorityQueue` instead.
- `process_request` callbacks passed to *Rule* that do not accept two arguments are deprecated.
- The following modules are deprecated:
  - `scrapy.utils.http` (use w3lib.http)
  - `scrapy.utils.markup` (use w3lib.html)
  - `scrapy.utils.multipart` (use urllib3)
- The `scrapy.utils.datatypes.MergeDict` class is deprecated for Python 3 code bases. Use `ChainMap` instead. (issue 3878)
- The `scrapy.utils.gz.is_gzipped` function is deprecated. Use `scrapy.utils.gz.gzip_magic_number` instead.

Other changes

- It is now possible to run all tests from the same tox environment in parallel; the documentation now covers *this and other ways to run tests* (issue 3707)
- It is now possible to generate an API documentation coverage report (issue 3806, issue 3810, issue 3860)
- The *documentation policies* now require docstrings (issue 3701) that follow PEP 257 (issue 3748)
- Internal fixes and cleanup (issue 3629, issue 3643, issue 3684, issue 3698, issue 3734, issue 3735, issue 3736, issue 3737, issue 3809, issue 3821, issue 3825, issue 3827, issue 3833, issue 3857, issue 3877)

7.1.38 Scrapy 1.6.0 (2019-01-30)

Highlights:

- better Windows support;
- Python 3.7 compatibility;
- big documentation improvements, including a switch from `.extract_first()` + `.extract()` API to `.get()` + `.getall()` API;
- feed exports, FilePipeline and MediaPipeline improvements;
- better extensibility: *item_error* and *request_reached_downloader* signals; `from_crawler` support for feed exporters, feed storages and dupefilters.
- `scrapy.contracts` fixes and new features;
- telnet console security improvements, first released as a backport in *Scrapy 1.5.2 (2019-01-22)*;
- clean-up of the deprecated code;
- various bug fixes, small new features and usability improvements across the codebase.

Selector API changes

While these are not changes in Scrapy itself, but rather in the parsel library which Scrapy uses for xpath/css selectors, these changes are worth mentioning here. Scrapy now depends on parsel >= 1.5, and Scrapy documentation is updated to follow recent `parsel` API conventions.

Most visible change is that `.get()` and `.getall()` selector methods are now preferred over `.extract_first()` and `.extract()`. We feel that these new methods result in a more concise and readable code. See *extract() and extract_first()* for more details.

> **Note**
>
> There are currently **no plans** to deprecate `.extract()` and `.extract_first()` methods.

Another useful new feature is the introduction of `Selector.attrib` and `SelectorList.attrib` properties, which make it easier to get attributes of HTML elements. See *Selecting element attributes*.

CSS selectors are cached in parsel >= 1.5, which makes them faster when the same CSS path is used many times. This is very common in case of Scrapy spiders: callbacks are usually called several times, on different pages.

If you're using custom `Selector` or `SelectorList` subclasses, a **backward incompatible** change in parsel may affect your code. See parsel changelog for a detailed description, as well as for the full list of improvements.

Telnet console

Backward incompatible: Scrapy's telnet console now requires username and password. See *Telnet Console* for more details. This change fixes a **security issue**; see *Scrapy 1.5.2 (2019-01-22)* release notes for details.

New extensibility features

- `from_crawler` support is added to feed exporters and feed storages. This, among other things, allows to access Scrapy settings from custom feed storages and exporters (issue 1605, issue 3348).
- `from_crawler` support is added to dupefilters (issue 2956); this allows to access e.g. settings or a spider from a dupefilter.
- *`item_error`* is fired when an error happens in a pipeline (issue 3256);
- *`request_reached_downloader`* is fired when Downloader gets a new Request; this signal can be useful e.g. for custom Schedulers (issue 3393).
- new SitemapSpider *`sitemap_filter()`* method which allows to select sitemap entries based on their attributes in SitemapSpider subclasses (issue 3512).
- Lazy loading of Downloader Handlers is now optional; this enables better initialization error handling in custom Downloader Handlers (issue 3394).

New FilePipeline and MediaPipeline features

- Expose more options for S3FilesStore: *`AWS_ENDPOINT_URL`*, *`AWS_USE_SSL`*, *`AWS_VERIFY`*, *`AWS_REGION_NAME`*. For example, this allows to use alternative or self-hosted AWS-compatible providers (issue 2609, issue 3548).
- ACL support for Google Cloud Storage: *`FILES_STORE_GCS_ACL`* and *`IMAGES_STORE_GCS_ACL`* (issue 3199).

`scrapy.contracts` improvements

- Exceptions in contracts code are handled better (issue 3377);
- `dont_filter=True` is used for contract requests, which allows to test different callbacks with the same URL (issue 3381);
- `request_cls` attribute in Contract subclasses allow to use different Request classes in contracts, for example FormRequest (issue 3383).
- Fixed errback handling in contracts, e.g. for cases where a contract is executed for URL which returns non-200 response (issue 3371).

Usability improvements

- more stats for RobotsTxtMiddleware (issue 3100)
- INFO log level is used to show telnet host/port (issue 3115)
- a message is added to IgnoreRequest in RobotsTxtMiddleware (issue 3113)
- better validation of `url` argument in `Response.follow` (issue 3131)
- non-zero exit code is returned from Scrapy commands when error happens on spider initialization (issue 3226)
- Link extraction improvements: "ftp" is added to scheme list (issue 3152); "flv" is added to common video extensions (issue 3165)
- better error message when an exporter is disabled (issue 3358);
- `scrapy shell --help` mentions syntax required for local files (`./file.html`) - issue 3496.
- Referer header value is added to RFPDupeFilter log messages (issue 3588)

Bug fixes

- fixed issue with extra blank lines in .csv exports under Windows (issue 3039);
- proper handling of pickling errors in Python 3 when serializing objects for disk queues (issue 3082)
- flags are now preserved when copying Requests (issue 3342);
- FormRequest.from_response clickdata shouldn't ignore elements with `input[type=image]` (issue 3153).
- FormRequest.from_response should preserve duplicate keys (issue 3247)

Documentation improvements

- Docs are re-written to suggest .get/.getall API instead of .extract/.extract_first. Also, *Selectors* docs are updated and re-structured to match latest parsel docs; they now contain more topics, such as *Selecting element attributes* or *Extensions to CSS Selectors* (issue 3390).
- *Using your browser's Developer Tools for scraping* is a new tutorial which replaces old Firefox and Firebug tutorials (issue 3400).
- SCRAPY_PROJECT environment variable is documented (issue 3518);
- troubleshooting section is added to install instructions (issue 3517);
- improved links to beginner resources in the tutorial (issue 3367, issue 3468);
- fixed *RETRY_HTTP_CODES* default values in docs (issue 3335);
- remove unused `DEPTH_STATS` option from docs (issue 3245);
- other cleanups (issue 3347, issue 3350, issue 3445, issue 3544, issue 3605).

Deprecation removals

Compatibility shims for pre-1.0 Scrapy module names are removed (issue 3318):

- `scrapy.command`
- `scrapy.contrib` (with all submodules)
- `scrapy.contrib_exp` (with all submodules)
- `scrapy.dupefilter`
- `scrapy.linkextractor`

- `scrapy.project`
- `scrapy.spider`
- `scrapy.spidermanager`
- `scrapy.squeue`
- `scrapy.stats`
- `scrapy.statscol`
- `scrapy.utils.decorator`

See *Module Relocations* for more information, or use suggestions from Scrapy 1.5.x deprecation warnings to update your code.

Other deprecation removals:

- Deprecated scrapy.interfaces.ISpiderManager is removed; please use scrapy.interfaces.ISpiderLoader.
- Deprecated `CrawlerSettings` class is removed (issue 3327).
- Deprecated `Settings.overrides` and `Settings.defaults` attributes are removed (issue 3327, issue 3359).

Other improvements, cleanups

- All Scrapy tests now pass on Windows; Scrapy testing suite is executed in a Windows environment on CI (issue 3315).
- Python 3.7 support (issue 3326, issue 3150, issue 3547).
- Testing and CI fixes (issue 3526, issue 3538, issue 3308, issue 3311, issue 3309, issue 3305, issue 3210, issue 3299)
- `scrapy.http.cookies.CookieJar.clear` accepts "domain", "path" and "name" optional arguments (issue 3231).
- additional files are included to sdist (issue 3495);
- code style fixes (issue 3405, issue 3304);
- unneeded .strip() call is removed (issue 3519);
- collections.deque is used to store MiddlewareManager methods instead of a list (issue 3476)

7.1.39 Scrapy 1.5.2 (2019-01-22)

- *Security bugfix*: Telnet console extension can be easily exploited by rogue websites POSTing content to http://localhost:6023, we haven't found a way to exploit it from Scrapy, but it is very easy to trick a browser to do so and elevates the risk for local development environment.

  The fix is backward incompatible, it enables telnet user-password authentication by default with a random generated password. If you can't upgrade right away, please consider setting *TELNETCONSOLE_PORT* out of its default value.

  See *telnet console* documentation for more info

- Backport CI build failure under GCE environment due to boto import error.

7.1.40 Scrapy 1.5.1 (2018-07-12)

This is a maintenance release with important bug fixes, but no new features:

- `O(N^2)` gzip decompression issue which affected Python 3 and PyPy is fixed (issue 3281);
- skipping of TLS validation errors is improved (issue 3166);
- Ctrl-C handling is fixed in Python 3.5+ (issue 3096);
- testing fixes (issue 3092, issue 3263);
- documentation improvements (issue 3058, issue 3059, issue 3089, issue 3123, issue 3127, issue 3189, issue 3224, issue 3280, issue 3279, issue 3201, issue 3260, issue 3284, issue 3298, issue 3294).

7.1.41 Scrapy 1.5.0 (2017-12-29)

This release brings small new features and improvements across the codebase. Some highlights:

- Google Cloud Storage is supported in FilesPipeline and ImagesPipeline.
- Crawling with proxy servers becomes more efficient, as connections to proxies can be reused now.
- Warnings, exception and logging messages are improved to make debugging easier.
- `scrapy parse` command now allows to set custom request meta via `--meta` argument.
- Compatibility with Python 3.6, PyPy and PyPy3 is improved; PyPy and PyPy3 are now supported officially, by running tests on CI.
- Better default handling of HTTP 308, 522 and 524 status codes.
- Documentation is improved, as usual.

Backward Incompatible Changes

- Scrapy 1.5 drops support for Python 3.3.
- Default Scrapy User-Agent now uses https link to scrapy.org (issue 2983). **This is technically backward-incompatible**; override *`USER_AGENT`* if you relied on old value.
- Logging of settings overridden by `custom_settings` is fixed; **this is technically backward-incompatible** because the logger changes from `[scrapy.utils.log]` to `[scrapy.crawler]`. If you're parsing Scrapy logs, please update your log parsers (issue 1343).
- LinkExtractor now ignores `m4v` extension by default, this is change in behavior.
- 522 and 524 status codes are added to `RETRY_HTTP_CODES` (issue 2851)

New features

- Support `<link>` tags in `Response.follow` (issue 2785)
- Support for `ptpython` REPL (issue 2654)
- Google Cloud Storage support for FilesPipeline and ImagesPipeline (issue 2923).
- New `--meta` option of the "scrapy parse" command allows to pass additional request.meta (issue 2883)
- Populate spider variable when using `shell.inspect_response` (issue 2812)
- Handle HTTP 308 Permanent Redirect (issue 2844)
- Add 522 and 524 to `RETRY_HTTP_CODES` (issue 2851)
- Log versions information at startup (issue 2857)

- `scrapy.mail.MailSender` now works in Python 3 (it requires Twisted 17.9.0)
- Connections to proxy servers are reused (issue 2743)
- Add template for a downloader middleware (issue 2755)
- Explicit message for NotImplementedError when parse callback not defined (issue 2831)
- CrawlerProcess got an option to disable installation of root log handler (issue 2921)
- LinkExtractor now ignores `m4v` extension by default
- Better log messages for responses over *DOWNLOAD_WARNSIZE* and *DOWNLOAD_MAXSIZE* limits (issue 2927)
- Show warning when a URL is put to `Spider.allowed_domains` instead of a domain (issue 2250).

Bug fixes

- Fix logging of settings overridden by `custom_settings`; **this is technically backward-incompatible** because the logger changes from `[scrapy.utils.log]` to `[scrapy.crawler]`, so please update your log parsers if needed (issue 1343)
- Default Scrapy User-Agent now uses https link to scrapy.org (issue 2983). **This is technically backward-incompatible**; override *USER_AGENT* if you relied on old value.
- Fix PyPy and PyPy3 test failures, support them officially (issue 2793, issue 2935, issue 2990, issue 3050, issue 2213, issue 3048)
- Fix DNS resolver when `DNSCACHE_ENABLED=False` (issue 2811)
- Add `cryptography` for Debian Jessie tox test env (issue 2848)
- Add verification to check if Request callback is callable (issue 2766)
- Port `extras/qpsclient.py` to Python 3 (issue 2849)
- Use getfullargspec under the scenes for Python 3 to stop DeprecationWarning (issue 2862)
- Update deprecated test aliases (issue 2876)
- Fix `SitemapSpider` support for alternate links (issue 2853)

Docs

- Added missing bullet point for the `AUTOTHROTTLE_TARGET_CONCURRENCY` setting. (issue 2756)
- Update Contributing docs, document new support channels (issue 2762, issue:*3038*)
- Include references to Scrapy subreddit in the docs
- Fix broken links; use `https://` for external links (issue 2978, issue 2982, issue 2958)
- Document CloseSpider extension better (issue 2759)
- Use `pymongo.collection.Collection.insert_one()` in MongoDB example (issue 2781)
- Spelling mistake and typos (issue 2828, issue 2837, issue 2884, issue 2924)
- Clarify `CSVFeedSpider.headers` documentation (issue 2826)
- Document `DontCloseSpider` exception and clarify `spider_idle` (issue 2791)
- Update "Releases" section in README (issue 2764)
- Fix rst syntax in `DOWNLOAD_FAIL_ON_DATALOSS` docs (issue 2763)
- Small fix in description of startproject arguments (issue 2866)
- Clarify data types in Response.body docs (issue 2922)

- Add a note about `request.meta['depth']` to DepthMiddleware docs (issue 2374)
- Add a note about `request.meta['dont_merge_cookies']` to CookiesMiddleware docs (issue 2999)
- Up-to-date example of project structure (issue 2964, issue 2976)
- A better example of ItemExporters usage (issue 2989)
- Document `from_crawler` methods for spider and downloader middlewares (issue 3019)

7.1.42 Scrapy 1.4.0 (2017-05-18)

Scrapy 1.4 does not bring that many breathtaking new features but quite a few handy improvements nonetheless.

Scrapy now supports anonymous FTP sessions with customizable user and password via the new *FTP_USER* and *FTP_PASSWORD* settings. And if you're using Twisted version 17.1.0 or above, FTP is now available with Python 3.

There's a new *response.follow* method for creating requests; **it is now a recommended way to create Requests in Scrapy spiders**. This method makes it easier to write correct spiders; `response.follow` has several advantages over creating `scrapy.Request` objects directly:

- it handles relative URLs;
- it works properly with non-ascii URLs on non-UTF8 pages;
- in addition to absolute and relative URLs it supports Selectors; for <a> elements it can also extract their href values.

For example, instead of this:

```
for href in response.css('li.page a::attr(href)').extract():
    url = response.urljoin(href)
    yield scrapy.Request(url, self.parse, encoding=response.encoding)
```

One can now write this:

```
for a in response.css('li.page a'):
    yield response.follow(a, self.parse)
```

Link extractors are also improved. They work similarly to what a regular modern browser would do: leading and trailing whitespace are removed from attributes (think `href=" http://example.com"`) when building `Link` objects. This whitespace-stripping also happens for `action` attributes with `FormRequest`.

Please also note that link extractors do not canonicalize URLs by default anymore. This was puzzling users every now and then, and it's not what browsers do in fact, so we removed that extra transformation on extracted links.

For those of you wanting more control on the `Referer:` header that Scrapy sends when following links, you can set your own `Referrer Policy`. Prior to Scrapy 1.4, the default `RefererMiddleware` would simply and blindly set it to the URL of the response that generated the HTTP request (which could leak information on your URL seeds). By default, Scrapy now behaves much like your regular browser does. And this policy is fully customizable with W3C standard values (or with something really custom of your own if you wish). See *REFERRER_POLICY* for details.

To make Scrapy spiders easier to debug, Scrapy logs more stats by default in 1.4: memory usage stats, detailed retry stats, detailed HTTP error code stats. A similar change is that HTTP cache path is also visible in logs now.

Last but not least, Scrapy now has the option to make JSON and XML items more human-readable, with newlines between items and even custom indenting offset, using the new *FEED_EXPORT_INDENT* setting.

Enjoy! (Or read on for the rest of changes in this release.)

Deprecations and Backward Incompatible Changes

- Default to `canonicalize=False` in *`scrapy.linkextractors.LinkExtractor`* (issue 2537, fixes issue 1941 and issue 1982): **warning, this is technically backward-incompatible**
- Enable memusage extension by default (issue 2539, fixes issue 2187); **this is technically backward-incompatible** so please check if you have any non-default `MEMUSAGE_***` options set.
- `EDITOR` environment variable now takes precedence over `EDITOR` option defined in settings.py (issue 1829); Scrapy default settings no longer depend on environment variables. **This is technically a backward incompatible change**.
- `Spider.make_requests_from_url` is deprecated (issue 1728, fixes issue 1495).

New Features

- Accept proxy credentials in *`proxy`* request meta key (issue 2526)
- Support brotli-compressed content; requires optional brotlipy (issue 2535)
- New *response.follow* shortcut for creating requests (issue 1940)
- Added `flags` argument and attribute to *`Request`* objects (issue 2047)
- Support Anonymous FTP (issue 2342)
- Added `retry/count`, `retry/max_reached` and `retry/reason_count/<reason>` stats to *`RetryMiddleware`* (issue 2543)
- Added `httperror/response_ignored_count` and `httperror/response_ignored_status_count/<status>` stats to *`HttpErrorMiddleware`* (issue 2566)
- Customizable *`Referrer policy`* in *`RefererMiddleware`* (issue 2306)
- New `data:` URI download handler (issue 2334, fixes issue 2156)
- Log cache directory when HTTP Cache is used (issue 2611, fixes issue 2604)
- Warn users when project contains duplicate spider names (fixes issue 2181)
- `scrapy.utils.datatypes.CaselessDict` now accepts `Mapping` instances and not only dicts (issue 2646)
- *Media downloads*, with *`FilesPipeline`* or *`ImagesPipeline`*, can now optionally handle HTTP redirects using the new *`MEDIA_ALLOW_REDIRECTS`* setting (issue 2616, fixes issue 2004)
- Accept non-complete responses from websites using a new *`DOWNLOAD_FAIL_ON_DATALOSS`* setting (issue 2590, fixes issue 2586)
- Optional pretty-printing of JSON and XML items via *`FEED_EXPORT_INDENT`* setting (issue 2456, fixes issue 1327)
- Allow dropping fields in `FormRequest.from_response` formdata when `None` value is passed (issue 667)
- Per-request retry times with the new *`max_retry_times`* meta key (issue 2642)
- `python -m scrapy` as a more explicit alternative to `scrapy` command (issue 2740)

Bug fixes

- LinkExtractor now strips leading and trailing whitespaces from attributes (issue 2547, fixes issue 1614)
- Properly handle whitespaces in action attribute in *`FormRequest`* (issue 2548)
- Buffer CONNECT response bytes from proxy until all HTTP headers are received (issue 2495, fixes issue 2491)
- FTP downloader now works on Python 3, provided you use Twisted>=17.1 (issue 2599)

- Use body to choose response type after decompressing content (issue 2393, fixes issue 2145)
- Always decompress `Content-Encoding: gzip` at *HttpCompressionMiddleware* stage (issue 2391)
- Respect custom log level in `Spider.custom_settings` (issue 2581, fixes issue 1612)
- 'make htmlview' fix for macOS (issue 2661)
- Remove "commands" from the command list (issue 2695)
- Fix duplicate Content-Length header for POST requests with empty body (issue 2677)
- Properly cancel large downloads, i.e. above *DOWNLOAD_MAXSIZE* (issue 1616)
- ImagesPipeline: fixed processing of transparent PNG images with palette (issue 2675)

Cleanups & Refactoring

- Tests: remove temp files and folders (issue 2570), fixed ProjectUtilsTest on macOS (issue 2569), use portable pypy for Linux on Travis CI (issue 2710)
- Separate building request from `_requests_to_follow` in CrawlSpider (issue 2562)
- Remove "Python 3 progress" badge (issue 2567)
- Add a couple more lines to `.gitignore` (issue 2557)
- Remove bumpversion prerelease configuration (issue 2159)
- Add codecov.yml file (issue 2750)
- Set context factory implementation based on Twisted version (issue 2577, fixes issue 2560)
- Add omitted `self` arguments in default project middleware template (issue 2595)
- Remove redundant `slot.add_request()` call in ExecutionEngine (issue 2617)
- Catch more specific `os.error` exception in `scrapy.pipelines.files.FSFilesStore` (issue 2644)
- Change "localhost" test server certificate (issue 2720)
- Remove unused `MEMUSAGE_REPORT` setting (issue 2576)

Documentation

- Binary mode is required for exporters (issue 2564, fixes issue 2553)
- Mention issue with *FormRequest.from_response()* due to bug in lxml (issue 2572)
- Use single quotes uniformly in templates (issue 2596)
- Document *ftp_user* and *ftp_password* meta keys (issue 2587)
- Removed section on deprecated `contrib/` (issue 2636)
- Recommend Anaconda when installing Scrapy on Windows (issue 2477, fixes issue 2475)
- FAQ: rewrite note on Python 3 support on Windows (issue 2690)
- Rearrange selector sections (issue 2705)
- Remove `__nonzero__` from *SelectorList* docs (issue 2683)
- Mention how to disable request filtering in documentation of *DUPEFILTER_CLASS* setting (issue 2714)
- Add sphinx_rtd_theme to docs setup readme (issue 2668)
- Open file in text mode in JSON item writer example (issue 2729)
- Clarify `allowed_domains` example (issue 2670)

7.1.43 Scrapy 1.3.3 (2017-03-10)

Bug fixes

- Make `SpiderLoader` raise `ImportError` again by default for missing dependencies and wrong *`SPIDER_MODULES`*. These exceptions were silenced as warnings since 1.3.0. A new setting is introduced to toggle between warning or exception if needed ; see *`SPIDER_LOADER_WARN_ONLY`* for details.

7.1.44 Scrapy 1.3.2 (2017-02-13)

Bug fixes

- Preserve request class when converting to/from dicts (utils.reqser) (issue 2510).
- Use consistent selectors for author field in tutorial (issue 2551).
- Fix TLS compatibility in Twisted 17+ (issue 2558)

7.1.45 Scrapy 1.3.1 (2017-02-08)

New features

- Support `'True'` and `'False'` string values for boolean settings (issue 2519); you can now do something like `scrapy crawl myspider -s REDIRECT_ENABLED=False`.
- Support kwargs with `response.xpath()` to use *XPath variables* and ad-hoc namespaces declarations ; this requires at least Parsel v1.1 (issue 2457).
- Add support for Python 3.6 (issue 2485).
- Run tests on PyPy (warning: some tests still fail, so PyPy is not supported yet).

Bug fixes

- Enforce `DNS_TIMEOUT` setting (issue 2496).
- Fix *`view`* command ; it was a regression in v1.3.0 (issue 2503).
- Fix tests regarding `*_EXPIRES settings` with Files/Images pipelines (issue 2460).
- Fix name of generated pipeline class when using basic project template (issue 2466).
- Fix compatibility with Twisted 17+ (issue 2496, issue 2528).
- Fix `scrapy.Item` inheritance on Python 3.6 (issue 2511).
- Enforce numeric values for components order in `SPIDER_MIDDLEWARES`, `DOWNLOADER_MIDDLEWARES`, `EXTENSIONS` and `SPIDER_CONTRACTS` (issue 2420).

Documentation

- Reword Code of Conduct section and upgrade to Contributor Covenant v1.4 (issue 2469).
- Clarify that passing spider arguments converts them to spider attributes (issue 2483).
- Document `formid` argument on `FormRequest.from_response()` (issue 2497).
- Add .rst extension to README files (issue 2507).
- Mention LevelDB cache storage backend (issue 2525).
- Use `yield` in sample callback code (issue 2533).
- Add note about HTML entities decoding with `.re()/.re_first()` (issue 1704).

- Typos (issue 2512, issue 2534, issue 2531).

Cleanups

- Remove redundant check in `MetaRefreshMiddleware` (issue 2542).
- Faster checks in `LinkExtractor` for allow/deny patterns (issue 2538).
- Remove dead code supporting old Twisted versions (issue 2544).

7.1.46 Scrapy 1.3.0 (2016-12-21)

This release comes rather soon after 1.2.2 for one main reason: it was found out that releases since 0.18 up to 1.2.2 (included) use some backported code from Twisted (`scrapy.xlib.tx.*`), even if newer Twisted modules are available. Scrapy now uses `twisted.web.client` and `twisted.internet.endpoints` directly. (See also cleanups below.)

As it is a major change, we wanted to get the bug fix out quickly while not breaking any projects using the 1.2 series.

New Features

- `MailSender` now accepts single strings as values for `to` and `cc` arguments (issue 2272)
- `scrapy fetch url`, `scrapy shell url` and `fetch(url)` inside Scrapy shell now follow HTTP redirections by default (issue 2290); See *fetch* and *shell* for details.
- `HttpErrorMiddleware` now logs errors with `INFO` level instead of `DEBUG`; this is technically **backward incompatible** so please check your log parsers.
- By default, logger names now use a long-form path, e.g. `[scrapy.extensions.logstats]`, instead of the shorter "top-level" variant of prior releases (e.g. `[scrapy]`); this is **backward incompatible** if you have log parsers expecting the short logger name part. You can switch back to short logger names using *LOG_SHORT_NAMES* set to `True`.

Dependencies & Cleanups

- Scrapy now requires Twisted >= 13.1 which is the case for many Linux distributions already.
- As a consequence, we got rid of `scrapy.xlib.tx.*` modules, which copied some of Twisted code for users stuck with an "old" Twisted version
- `ChunkedTransferMiddleware` is deprecated and removed from the default downloader middlewares.

7.1.47 Scrapy 1.2.3 (2017-03-03)

- Packaging fix: disallow unsupported Twisted versions in setup.py

7.1.48 Scrapy 1.2.2 (2016-12-06)

Bug fixes

- Fix a cryptic traceback when a pipeline fails on `open_spider()` (issue 2011)
- Fix embedded IPython shell variables (fixing issue 396 that re-appeared in 1.2.0, fixed in issue 2418)
- A couple of patches when dealing with robots.txt:
  - handle (non-standard) relative sitemap URLs (issue 2390)
  - handle non-ASCII URLs and User-Agents in Python 2 (issue 2373)

Documentation

- Document "download_latency" key in Request's meta dict (issue 2033)
- Remove page on (deprecated & unsupported) Ubuntu packages from ToC (issue 2335)
- A few fixed typos (issue 2346, issue 2369, issue 2369, issue 2380) and clarifications (issue 2354, issue 2325, issue 2414)

Other changes

- Advertize conda-forge as Scrapy's official conda channel (issue 2387)
- More helpful error messages when trying to use .css() or .xpath() on non-Text Responses (issue 2264)
- startproject command now generates a sample middlewares.py file (issue 2335)
- Add more dependencies' version info in scrapy version verbose output (issue 2404)
- Remove all *.pyc files from source distribution (issue 2386)

7.1.49 Scrapy 1.2.1 (2016-10-21)

Bug fixes

- Include OpenSSL's more permissive default ciphers when establishing TLS/SSL connections (issue 2314).
- Fix "Location" HTTP header decoding on non-ASCII URL redirects (issue 2321).

Documentation

- Fix JsonWriterPipeline example (issue 2302).
- Various notes: issue 2330 on spider names, issue 2329 on middleware methods processing order, issue 2327 on getting multi-valued HTTP headers as lists.

Other changes

- Removed www. from start_urls in built-in spider templates (issue 2299).

7.1.50 Scrapy 1.2.0 (2016-10-03)

New Features

- New *FEED_EXPORT_ENCODING* setting to customize the encoding used when writing items to a file. This can be used to turn off \uXXXX escapes in JSON output. This is also useful for those wanting something else than UTF-8 for XML or CSV output (issue 2034).
- startproject command now supports an optional destination directory to override the default one based on the project name (issue 2005).
- New *SCHEDULER_DEBUG* setting to log requests serialization failures (issue 1610).
- JSON encoder now supports serialization of set instances (issue 2058).
- Interpret application/json-amazonui-streaming as TextResponse (issue 1503).
- scrapy is imported by default when using shell tools (*shell*, *inspect_response*) (issue 2248).

Bug fixes

- DefaultRequestHeaders middleware now runs before UserAgent middleware (issue 2088). **Warning: this is technically backward incompatible**, though we consider this a bug fix.
- HTTP cache extension and plugins that use the `.scrapy` data directory now work outside projects (issue 1581). **Warning: this is technically backward incompatible**, though we consider this a bug fix.
- `Selector` does not allow passing both `response` and `text` anymore (issue 2153).
- Fixed logging of wrong callback name with `scrapy parse` (issue 2169).
- Fix for an odd gzip decompression bug (issue 1606).
- Fix for selected callbacks when using `CrawlSpider` with *`scrapy parse`* (issue 2225).
- Fix for invalid JSON and XML files when spider yields no items (issue 872).
- Implement `flush()` for `StreamLogger` avoiding a warning in logs (issue 2125).

Refactoring

- `canonicalize_url` has been moved to w3lib.url (issue 2168).

Tests & Requirements

Scrapy's new requirements baseline is Debian 8 "Jessie". It was previously Ubuntu 12.04 Precise. What this means in practice is that we run continuous integration tests with these (main) packages versions at a minimum: Twisted 14.0, pyOpenSSL 0.14, lxml 3.4.

Scrapy may very well work with older versions of these packages (the code base still has switches for older Twisted versions for example) but it is not guaranteed (because it's not tested anymore).

Documentation

- Grammar fixes: issue 2128, issue 1566.
- Download stats badge removed from README (issue 2160).
- New Scrapy *architecture diagram* (issue 2165).
- Updated `Response` parameters documentation (issue 2197).
- Reworded misleading *`RANDOMIZE_DOWNLOAD_DELAY`* description (issue 2190).
- Add StackOverflow as a support channel (issue 2257).

7.1.51 Scrapy 1.1.4 (2017-03-03)

- Packaging fix: disallow unsupported Twisted versions in setup.py

7.1.52 Scrapy 1.1.3 (2016-09-22)

Bug fixes

- Class attributes for subclasses of `ImagesPipeline` and `FilesPipeline` work as they did before 1.1.1 (issue 2243, fixes issue 2198)

Documentation

- *Overview* and *tutorial* rewritten to use http://toscrape.com websites (issue 2236, issue 2249, issue 2252).

7.1.53 Scrapy 1.1.2 (2016-08-18)

Bug fixes

- Introduce a missing *IMAGES_STORE_S3_ACL* setting to override the default ACL policy in `ImagesPipeline` when uploading images to S3 (note that default ACL policy is "private" – instead of "public-read" – since Scrapy 1.1.0)
- *IMAGES_EXPIRES* default value set back to 90 (the regression was introduced in 1.1.1)

7.1.54 Scrapy 1.1.1 (2016-07-13)

Bug fixes

- Add "Host" header in CONNECT requests to HTTPS proxies (issue 2069)
- Use response `body` when choosing response class (issue 2001, fixes issue 2000)
- Do not fail on canonicalizing URLs with wrong netlocs (issue 2038, fixes issue 2010)
- a few fixes for `HttpCompressionMiddleware` (and `SitemapSpider`):
  - Do not decode HEAD responses (issue 2008, fixes issue 1899)
  - Handle charset parameter in gzip Content-Type header (issue 2050, fixes issue 2049)
  - Do not decompress gzip octet-stream responses (issue 2065, fixes issue 2063)
- Catch (and ignore with a warning) exception when verifying certificate against IP-address hosts (issue 2094, fixes issue 2092)
- Make `FilesPipeline` and `ImagesPipeline` backward compatible again regarding the use of legacy class attributes for customization (issue 1989, fixes issue 1985)

New features

- Enable genspider command outside project folder (issue 2052)
- Retry HTTPS CONNECT `TunnelError` by default (issue 1974)

Documentation

- `FEED_TEMPDIR` setting at lexicographical position (commit 9b3c72c)
- Use idiomatic `.extract_first()` in overview (issue 1994)
- Update years in copyright notice (commit c2c8036)
- Add information and example on errbacks (issue 1995)
- Use "url" variable in downloader middleware example (issue 2015)
- Grammar fixes (issue 2054, issue 2120)
- New FAQ entry on using BeautifulSoup in spider callbacks (issue 2048)
- Add notes about Scrapy not working on Windows with Python 3 (issue 2060)
- Encourage complete titles in pull requests (issue 2026)

Tests

- Upgrade py.test requirement on Travis CI and Pin pytest-cov to 2.2.1 (issue 2095)

7.1.55 Scrapy 1.1.0 (2016-05-11)

This 1.1 release brings a lot of interesting features and bug fixes:

- Scrapy 1.1 has beta Python 3 support (requires Twisted >= 15.5). See *Beta Python 3 Support* for more details and some limitations.
- Hot new features:
  - Item loaders now support nested loaders (issue 1467).
  - `FormRequest.from_response` improvements (issue 1382, issue 1137).
  - Added setting *AUTOTHROTTLE_TARGET_CONCURRENCY* and improved AutoThrottle docs (issue 1324).
  - Added `response.text` to get body as unicode (issue 1730).
  - Anonymous S3 connections (issue 1358).
  - Deferreds in downloader middlewares (issue 1473). This enables better robots.txt handling (issue 1471).
  - HTTP caching now follows RFC2616 more closely, added settings *HTTPCACHE_ALWAYS_STORE* and *HTTPCACHE_IGNORE_RESPONSE_CACHE_CONTROLS* (issue 1151).
  - Selectors were extracted to the parsel library (issue 1409). This means you can use Scrapy Selectors without Scrapy and also upgrade the selectors engine without needing to upgrade Scrapy.
  - HTTPS downloader now does TLS protocol negotiation by default, instead of forcing TLS 1.0. You can also set the SSL/TLS method using the new *DOWNLOADER_CLIENT_TLS_METHOD*.
- These bug fixes may require your attention:
  - Don't retry bad requests (HTTP 400) by default (issue 1289). If you need the old behavior, add `400` to *RETRY_HTTP_CODES*.
  - Fix shell files argument handling (issue 1710, issue 1550). If you try `scrapy shell index.html` it will try to load the URL `http://index.html`, use `scrapy shell ./index.html` to load a local file.
  - Robots.txt compliance is now enabled by default for newly-created projects (issue 1724). Scrapy will also wait for robots.txt to be downloaded before proceeding with the crawl (issue 1735). If you want to disable this behavior, update *ROBOTSTXT_OBEY* in `settings.py` file after creating a new project.
  - Exporters now work on unicode, instead of bytes by default (issue 1080). If you use *PythonItemExporter*, you may want to update your code to disable binary mode which is now deprecated.
  - Accept XML node names containing dots as valid (issue 1533).
  - When uploading files or images to S3 (with `FilesPipeline` or `ImagesPipeline`), the default ACL policy is now "private" instead of "public" **Warning: backward incompatible!**. You can use *FILES_STORE_S3_ACL* to change it.
  - We've reimplemented `canonicalize_url()` for more correct output, especially for URLs with non-ASCII characters (issue 1947). This could change link extractors output compared to previous Scrapy versions. This may also invalidate some cache entries you could still have from pre-1.1 runs. **Warning: backward incompatible!**.

Keep reading for more details on other improvements and bug fixes.

Beta Python 3 Support

We have been hard at work to make Scrapy run on Python 3. As a result, now you can run spiders on Python 3.3, 3.4 and 3.5 (Twisted >= 15.5 required). Some features are still missing (and some may never be ported).

Almost all builtin extensions/middlewares are expected to work. However, we are aware of some limitations in Python 3:

- Scrapy does not work on Windows with Python 3
- Sending emails is not supported
- FTP download handler is not supported
- Telnet console is not supported

Additional New Features and Enhancements

- Scrapy now has a Code of Conduct (issue 1681).
- Command line tool now has completion for zsh (issue 934).
- Improvements to `scrapy shell`:
  - Support for bpython and configure preferred Python shell via `SCRAPY_PYTHON_SHELL` (issue 1100, issue 1444).
  - Support URLs without scheme (issue 1498) **Warning: backward incompatible!**
  - Bring back support for relative file path (issue 1710, issue 1550).
- Added *`MEMUSAGE_CHECK_INTERVAL_SECONDS`* setting to change default check interval (issue 1282).
- Download handlers are now lazy-loaded on first request using their scheme (issue 1390, issue 1421).
- HTTPS download handlers do not force TLS 1.0 anymore; instead, OpenSSL's `SSLv23_method()/TLS_method()` is used allowing to try negotiating with the remote hosts the highest TLS protocol version it can (issue 1794, issue 1629).
- `RedirectMiddleware` now skips the status codes from `handle_httpstatus_list` on spider attribute or in `Request`'s `meta` key (issue 1334, issue 1364, issue 1447).
- Form submission:
  - now works with `<button>` elements too (issue 1469).
  - an empty string is now used for submit buttons without a value (issue 1472)
- Dict-like settings now have per-key priorities (issue 1135, issue 1149 and issue 1586).
- Sending non-ASCII emails (issue 1662)
- `CloseSpider` and `SpiderState` extensions now get disabled if no relevant setting is set (issue 1723, issue 1725).
- Added method `ExecutionEngine.close` (issue 1423).
- Added method `CrawlerRunner.create_crawler` (issue 1528).
- Scheduler priority queue can now be customized via *`SCHEDULER_PRIORITY_QUEUE`* (issue 1822).
- `.pps` links are now ignored by default in link extractors (issue 1835).
- temporary data folder for FTP and S3 feed storages can be customized using a new *`FEED_TEMPDIR`* setting (issue 1847).
- `FilesPipeline` and `ImagesPipeline` settings are now instance attributes instead of class attributes, enabling spider-specific behaviors (issue 1891).

- `JsonItemExporter` now formats opening and closing square brackets on their own line (first and last lines of output file) (issue 1950).
- If available, `botocore` is used for `S3FeedStorage`, `S3DownloadHandler` and `S3FilesStore` (issue 1761, issue 1883).
- Tons of documentation updates and related fixes (issue 1291, issue 1302, issue 1335, issue 1683, issue 1660, issue 1642, issue 1721, issue 1727, issue 1879).
- Other refactoring, optimizations and cleanup (issue 1476, issue 1481, issue 1477, issue 1315, issue 1290, issue 1750, issue 1881).

Deprecations and Removals

- Added `to_bytes` and `to_unicode`, deprecated `str_to_unicode` and `unicode_to_str` functions (issue 778).
- `binary_is_text` is introduced, to replace use of `isbinarytext` (but with inverse return value) (issue 1851)
- The `optional_features` set has been removed (issue 1359).
- The `--lsprof` command line option has been removed (issue 1689). **Warning: backward incompatible**, but doesn't break user code.
- The following datatypes were deprecated (issue 1720):
  - `scrapy.utils.datatypes.MultiValueDictKeyError`
  - `scrapy.utils.datatypes.MultiValueDict`
  - `scrapy.utils.datatypes.SiteNode`
- The previously bundled `scrapy.xlib.pydispatch` library was deprecated and replaced by pydispatcher.

Relocations

- `telnetconsole` was relocated to `extensions/` (issue 1524).
  - Note: telnet is not enabled on Python 3 (https://github.com/scrapy/scrapy/pull/1524#issuecomment-146985595)

Bugfixes

- Scrapy does not retry requests that got a `HTTP 400 Bad Request` response anymore (issue 1289). **Warning: backward incompatible!**
- Support empty password for http_proxy config (issue 1274).
- Interpret `application/x-json` as `TextResponse` (issue 1333).
- Support link rel attribute with multiple values (issue 1201).
- Fixed `scrapy.FormRequest.from_response` when there is a <base> tag (issue 1564).
- Fixed *`TEMPLATES_DIR`* handling (issue 1575).
- Various `FormRequest` fixes (issue 1595, issue 1596, issue 1597).
- Makes `_monkeypatches` more robust (issue 1634).
- Fixed bug on `XMLItemExporter` with non-string fields in items (issue 1738).
- Fixed startproject command in macOS (issue 1635).
- Fixed *`PythonItemExporter`* and CSVExporter for non-string item types (issue 1737).

- Various logging related fixes (issue 1294, issue 1419, issue 1263, issue 1624, issue 1654, issue 1722, issue 1726 and issue 1303).
- Fixed bug in `utils.template.render_templatefile()` (issue 1212).
- sitemaps extraction from `robots.txt` is now case-insensitive (issue 1902).
- HTTPS+CONNECT tunnels could get mixed up when using multiple proxies to same remote host (issue 1912).

7.1.56 Scrapy 1.0.7 (2017-03-03)

- Packaging fix: disallow unsupported Twisted versions in setup.py

7.1.57 Scrapy 1.0.6 (2016-05-04)

- FIX: RetryMiddleware is now robust to non-standard HTTP status codes (issue 1857)
- FIX: Filestorage HTTP cache was checking wrong modified time (issue 1875)
- DOC: Support for Sphinx 1.4+ (issue 1893)
- DOC: Consistency in selectors examples (issue 1869)

7.1.58 Scrapy 1.0.5 (2016-02-04)

- FIX: [Backport] Ignore bogus links in LinkExtractors (fixes issue 907, commit 108195e)
- TST: Changed buildbot makefile to use 'pytest' (commit 1f3d90a)
- DOC: Fixed typos in tutorial and media-pipeline (commit 808a9ea and commit 803bd87)
- DOC: Add AjaxCrawlMiddleware to DOWNLOADER_MIDDLEWARES_BASE in settings docs (commit aa94121)

7.1.59 Scrapy 1.0.4 (2015-12-30)

- Ignoring xlib/tx folder, depending on Twisted version. (commit 7dfa979)
- Run on new travis-ci infra (commit 6e42f0b)
- Spelling fixes (commit 823a1cc)
- escape nodename in xmliter regex (commit da3c155)
- test xml nodename with dots (commit 4418fc3)
- TST don't use broken Pillow version in tests (commit a55078c)
- disable log on version command. closes #1426 (commit 86fc330)
- disable log on startproject command (commit db4c9fe)
- Add PyPI download stats badge (commit df2b944)
- don't run tests twice on Travis if a PR is made from a scrapy/scrapy branch (commit a83ab41)
- Add Python 3 porting status badge to the README (commit 73ac80d)
- fixed RFPDupeFilter persistence (commit 97d080e)
- TST a test to show that dupefilter persistence is not working (commit 97f2fb3)
- explicit close file on file:// scheme handler (commit d9b4850)
- Disable dupefilter in shell (commit c0d0734)

- DOC: Add captions to toctrees which appear in sidebar (commit aa239ad)
- DOC Removed pywin32 from install instructions as it's already declared as dependency. (commit 10eb400)
- Added installation notes about using Conda for Windows and other OSes. (commit 1c3600a)
- Fixed minor grammar issues. (commit 7f4ddd5)
- fixed a typo in the documentation. (commit b71f677)
- Version 1 now exists (commit 5456c0e)
- fix another invalid xpath error (commit 0a1366e)
- fix ValueError: Invalid XPath: //div/[id="not-exists"]/text() on selectors.rst (commit ca8d60f)
- Typos corrections (commit 7067117)
- fix typos in downloader-middleware.rst and exceptions.rst, middlware -> middleware (commit 32f115c)
- Add note to Ubuntu install section about Debian compatibility (commit 23fda69)
- Replace alternative macOS install workaround with virtualenv (commit 98b63ee)
- Reference Homebrew's homepage for installation instructions (commit 1925db1)
- Add oldest supported tox version to contributing docs (commit 5d10d6d)
- Note in install docs about pip being already included in python>=2.7.9 (commit 85c980e)
- Add non-python dependencies to Ubuntu install section in the docs (commit fbd010d)
- Add macOS installation section to docs (commit d8f4cba)
- DOC(ENH): specify path to rtd theme explicitly (commit de73b1a)
- minor: scrapy.Spider docs grammar (commit 1ddcc7b)
- Make common practices sample code match the comments (commit 1b85bcf)
- nextcall repetitive calls (heartbeats). (commit 55f7104)
- Backport fix compatibility with Twisted 15.4.0 (commit b262411)
- pin pytest to 2.7.3 (commit a6535c2)
- Merge pull request #1512 from mgedmin/patch-1 (commit 8876111)
- Merge pull request #1513 from mgedmin/patch-2 (commit 5d4daf8)
- Typo (commit f8d0682)
- Fix list formatting (commit 5f83a93)
- fix Scrapy squeue tests after recent changes to queuelib (commit 3365c01)
- Merge pull request #1475 from rweindl/patch-1 (commit 2d688cd)
- Update tutorial.rst (commit fbc1f25)
- Merge pull request #1449 from rhoekman/patch-1 (commit 7d6538c)
- Small grammatical change (commit 8752294)
- Add openssl version to version command (commit 13c45ac)

7.1.60 Scrapy 1.0.3 (2015-08-11)

- add service_identity to Scrapy install_requires (commit cbc2501)
- Workaround for travis#296 (commit 66af9cd)

7.1.61 Scrapy 1.0.2 (2015-08-06)

- Twisted 15.3.0 does not raises PicklingError serializing lambda functions (commit b04dd7d)
- Minor method name fix (commit 6f85c7f)
- minor: scrapy.Spider grammar and clarity (commit 9c9d2e0)
- Put a blurb about support channels in CONTRIBUTING (commit c63882b)
- Fixed typos (commit a9ae7b0)
- Fix doc reference. (commit 7c8a4fe)

7.1.62 Scrapy 1.0.1 (2015-07-01)

- Unquote request path before passing to FTPClient, it already escape paths (commit cc00ad2)
- include tests/ to source distribution in MANIFEST.in (commit eca227e)
- DOC Fix SelectJmes documentation (commit b8567bc)
- DOC Bring Ubuntu and Archlinux outside of Windows subsection (commit 392233f)
- DOC remove version suffix from Ubuntu package (commit 5303c66)
- DOC Update release date for 1.0 (commit c89fa29)

7.1.63 Scrapy 1.0.0 (2015-06-19)

You will find a lot of new features and bugfixes in this major release. Make sure to check our updated *overview* to get a glance of some of the changes, along with our brushed *tutorial*.

Support for returning dictionaries in spiders

Declaring and returning Scrapy Items is no longer necessary to collect the scraped data from your spider, you can now return explicit dictionaries instead.

Classic version

```
class MyItem(scrapy.Item):
    url = scrapy.Field()

class MySpider(scrapy.Spider):
    def parse(self, response):
        return MyItem(url=response.url)
```

New version

```
class MySpider(scrapy.Spider):
    def parse(self, response):
        return {'url': response.url}
```

Per-spider settings (GSoC 2014)

Last Google Summer of Code project accomplished an important redesign of the mechanism used for populating settings, introducing explicit priorities to override any given setting. As an extension of that goal, we included a new level of priority for settings that act exclusively for a single spider, allowing them to redefine project settings.

Start using it by defining a `custom_settings` class variable in your spider:

```
class MySpider(scrapy.Spider):
    custom_settings = {
        "DOWNLOAD_DELAY": 5.0,
        "RETRY_ENABLED": False,
    }
```

Read more about settings population: *Settings*

Python Logging

Scrapy 1.0 has moved away from Twisted logging to support Python built in's as default logging system. We're maintaining backward compatibility for most of the old custom interface to call logging functions, but you'll get warnings to switch to the Python logging API entirely.

Old version

```
from scrapy import log
log.msg('MESSAGE', log.INFO)
```

New version

```
import logging
logging.info('MESSAGE')
```

Logging with spiders remains the same, but on top of the `log()` method you'll have access to a custom `logger` created for the spider to issue log events:

```
class MySpider(scrapy.Spider):
    def parse(self, response):
        self.logger.info('Response received')
```

Read more in the logging documentation: *Logging*

Crawler API refactoring (GSoC 2014)

Another milestone for last Google Summer of Code was a refactoring of the internal API, seeking a simpler and easier usage. Check new core interface in: *Core API*

A common situation where you will face these changes is while running Scrapy from scripts. Here's a quick example of how to run a Spider manually with the new API:

```
from scrapy.crawler import CrawlerProcess

process = CrawlerProcess({
    'USER_AGENT': 'Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 5.1)'
})
process.crawl(MySpider)
process.start()
```

Bear in mind this feature is still under development and its API may change until it reaches a stable status.

See more examples for scripts running Scrapy: *Common Practices*

Module Relocations

There's been a large rearrangement of modules trying to improve the general structure of Scrapy. Main changes were separating various subpackages into new projects and dissolving both `scrapy.contrib` and `scrapy.contrib_exp` into top level packages. Backward compatibility was kept among internal relocations, while importing deprecated modules expect warnings indicating their new place.

Full list of relocations

Outsourced packages

Note

These extensions went through some minor changes, e.g. some setting names were changed. Please check the documentation in each new repository to get familiar with the new usage.

Old location	New location
scrapy.commands.deploy	scrapyd-client (See other alternatives here: *Deploying Spiders*)
scrapy.contrib.djangoitem	scrapy-djangoitem
scrapy.webservice	scrapy-jsonrpc

`scrapy.contrib_exp` and `scrapy.contrib` dissolutions

Old location	New location
scrapy.contrib_exp.downloadermiddleware.decompressio	scrapy.downloadermiddlewares.decompression
scrapy.contrib_exp.iterators	scrapy.utils.iterators
scrapy.contrib.downloadermiddleware	scrapy.downloadermiddlewares
scrapy.contrib.exporter	scrapy.exporters
scrapy.contrib.linkextractors	scrapy.linkextractors
scrapy.contrib.loader	scrapy.loader
scrapy.contrib.loader.processor	scrapy.loader.processors
scrapy.contrib.pipeline	scrapy.pipelines
scrapy.contrib.spidermiddleware	scrapy.spidermiddlewares
scrapy.contrib.spiders	scrapy.spiders
• scrapy.contrib.closespider • scrapy.contrib.corestats • scrapy.contrib.debug • scrapy.contrib.feedexport • scrapy.contrib.httpcache • scrapy.contrib.logstats • scrapy.contrib.memdebug • scrapy.contrib.memusage • scrapy.contrib.spiderstate • scrapy.contrib.statsmailer • scrapy.contrib.throttle	scrapy.extensions.*

Plural renames and Modules unification

Old location	New location
scrapy.command	scrapy.commands
scrapy.dupefilter	scrapy.dupefilters
scrapy.linkextractor	scrapy.linkextractors
scrapy.spider	scrapy.spiders
scrapy.squeue	scrapy.squeues
scrapy.statscol	scrapy.statscollectors
scrapy.utils.decorator	scrapy.utils.decorators

Class renames

Old location	New location
scrapy.spidermanager.SpiderManager	scrapy.spiderloader.SpiderLoader

Settings renames

Old location	New location
SPIDER_MANAGER_CLASS	SPIDER_LOADER_CLASS

Changelog

New Features and Enhancements

- Python logging (issue 1060, issue 1235, issue 1236, issue 1240, issue 1259, issue 1278, issue 1286)
- FEED_EXPORT_FIELDS option (issue 1159, issue 1224)
- Dns cache size and timeout options (issue 1132)
- support namespace prefix in xmliter_lxml (issue 963)
- Reactor threadpool max size setting (issue 1123)
- Allow spiders to return dicts. (issue 1081)
- Add Response.urljoin() helper (issue 1086)
- look in ~/.config/scrapy.cfg for user config (issue 1098)
- handle TLS SNI (issue 1101)
- Selectorlist extract first (issue 624, issue 1145)
- Added JmesSelect (issue 1016)
- add gzip compression to filesystem http cache backend (issue 1020)
- CSS support in link extractors (issue 983)
- httpcache dont_cache meta #19 #689 (issue 821)
- add signal to be sent when request is dropped by the scheduler (issue 961)
- avoid download large response (issue 946)
- Allow to specify the quotechar in CSVFeedSpider (issue 882)
- Add referer to "Spider error processing" log message (issue 795)
- process robots.txt once (issue 896)
- GSoC Per-spider settings (issue 854)
- Add project name validation (issue 817)
- GSoC API cleanup (issue 816, issue 1128, issue 1147, issue 1148, issue 1156, issue 1185, issue 1187, issue 1258, issue 1268, issue 1276, issue 1285, issue 1284)
- Be more responsive with IO operations (issue 1074 and issue 1075)
- Do leveldb compaction for httpcache on closing (issue 1297)

Deprecations and Removals

- Deprecate htmlparser link extractor (issue 1205)
- remove deprecated code from FeedExporter (issue 1155)
- a leftover for.15 compatibility (issue 925)
- drop support for CONCURRENT_REQUESTS_PER_SPIDER (issue 895)
- Drop old engine code (issue 911)

- Deprecate SgmlLinkExtractor (issue 777)

Relocations

- Move exporters/__init__.py to exporters.py (issue 1242)
- Move base classes to their packages (issue 1218, issue 1233)
- Module relocation (issue 1181, issue 1210)
- rename SpiderManager to SpiderLoader (issue 1166)
- Remove djangoitem (issue 1177)
- remove scrapy deploy command (issue 1102)
- dissolve contrib_exp (issue 1134)
- Deleted bin folder from root, fixes #913 (issue 914)
- Remove jsonrpc based webservice (issue 859)
- Move Test cases under project root dir (issue 827, issue 841)
- Fix backward incompatibility for relocated paths in settings (issue 1267)

Documentation

- CrawlerProcess documentation (issue 1190)
- Favoring web scraping over screen scraping in the descriptions (issue 1188)
- Some improvements for Scrapy tutorial (issue 1180)
- Documenting Files Pipeline together with Images Pipeline (issue 1150)
- deployment docs tweaks (issue 1164)
- Added deployment section covering scrapyd-deploy and shub (issue 1124)
- Adding more settings to project template (issue 1073)
- some improvements to overview page (issue 1106)
- Updated link in docs/topics/architecture.rst (issue 647)
- DOC reorder topics (issue 1022)
- updating list of Request.meta special keys (issue 1071)
- DOC document download_timeout (issue 898)
- DOC simplify extension docs (issue 893)
- Leaks docs (issue 894)
- DOC document from_crawler method for item pipelines (issue 904)
- Spider_error doesn't support deferreds (issue 1292)
- Corrections & Sphinx related fixes (issue 1220, issue 1219, issue 1196, issue 1172, issue 1171, issue 1169, issue 1160, issue 1154, issue 1127, issue 1112, issue 1105, issue 1041, issue 1082, issue 1033, issue 944, issue 866, issue 864, issue 796, issue 1260, issue 1271, issue 1293, issue 1298)

Bugfixes

- Item multi inheritance fix (issue 353, issue 1228)
- ItemLoader.load_item: iterate over copy of fields (issue 722)
- Fix Unhandled error in Deferred (RobotsTxtMiddleware) (issue 1131, issue 1197)

- Force to read DOWNLOAD_TIMEOUT as int (issue 954)
- scrapy.utils.misc.load_object should print full traceback (issue 902)
- Fix bug for ".local" host name (issue 878)
- Fix for Enabled extensions, middlewares, pipelines info not printed anymore (issue 879)
- fix dont_merge_cookies bad behaviour when set to false on meta (issue 846)

Python 3 In Progress Support

- disable scrapy.telnet if twisted.conch is not available (issue 1161)
- fix Python 3 syntax errors in ajaxcrawl.py (issue 1162)
- more python3 compatibility changes for urllib (issue 1121)
- assertItemsEqual was renamed to assertCountEqual in Python 3. (issue 1070)
- Import unittest.mock if available. (issue 1066)
- updated deprecated cgi.parse_qsl to use six's parse_qsl (issue 909)
- Prevent Python 3 port regressions (issue 830)
- PY3: use MutableMapping for python 3 (issue 810)
- PY3: use six.BytesIO and six.moves.cStringIO (issue 803)
- PY3: fix xmlrpclib and email imports (issue 801)
- PY3: use six for robotparser and urlparse (issue 800)
- PY3: use six.iterkeys, six.iteritems, and tempfile (issue 799)
- PY3: fix has_key and use six.moves.configparser (issue 798)
- PY3: use six.moves.cPickle (issue 797)
- PY3 make it possible to run some tests in Python3 (issue 776)

Tests

- remove unnecessary lines from py3-ignores (issue 1243)
- Fix remaining warnings from pytest while collecting tests (issue 1206)
- Add docs build to travis (issue 1234)
- TST don't collect tests from deprecated modules. (issue 1165)
- install service_identity package in tests to prevent warnings (issue 1168)
- Fix deprecated settings API in tests (issue 1152)
- Add test for webclient with POST method and no body given (issue 1089)
- py3-ignores.txt supports comments (issue 1044)
- modernize some of the asserts (issue 835)
- selector.__repr__ test (issue 779)

Code refactoring

- CSVFeedSpider cleanup: use iterate_spider_output (issue 1079)
- remove unnecessary check from scrapy.utils.spider.iter_spider_output (issue 1078)
- Pydispatch pep8 (issue 992)

- Removed unused 'load=False' parameter from walk_modules() (issue 871)
- For consistency, use `job_dir` helper in `SpiderState` extension. (issue 805)
- rename "sflo" local variables to less cryptic "log_observer" (issue 775)

7.1.64 Scrapy 0.24.6 (2015-04-20)

- encode invalid xpath with unicode_escape under PY2 (commit 07cb3e5)
- fix IPython shell scope issue and load IPython user config (commit 2c8e573)
- Fix small typo in the docs (commit d694019)
- Fix small typo (commit f92fa83)
- Converted sel.xpath() calls to response.xpath() in Extracting the data (commit c2c6d15)

7.1.65 Scrapy 0.24.5 (2015-02-25)

- Support new _getEndpoint Agent signatures on Twisted 15.0.0 (commit 540b9bc)
- DOC a couple more references are fixed (commit b4c454b)
- DOC fix a reference (commit e3c1260)
- t.i.b.ThreadedResolver is now a new-style class (commit 9e13f42)
- S3DownloadHandler: fix auth for requests with quoted paths/query params (commit cdb9a0b)
- fixed the variable types in mailsender documentation (commit bb3a848)
- Reset items_scraped instead of item_count (commit edb07a4)
- Tentative attention message about what document to read for contributions (commit 7ee6f7a)
- mitmproxy 0.10.1 needs netlib 0.10.1 too (commit 874fcdd)
- pin mitmproxy 0.10.1 as >0.11 does not work with tests (commit c6b21f0)
- Test the parse command locally instead of against an external url (commit c3a6628)
- Patches Twisted issue while closing the connection pool on HTTPDownloadHandler (commit d0bf957)
- Updates documentation on dynamic item classes. (commit eeb589a)
- Merge pull request #943 from Lazar-T/patch-3 (commit 5fdab02)
- typo (commit b0ae199)
- pywin32 is required by Twisted. closes #937 (commit 5cb0cfb)
- Update install.rst (commit 781286b)
- Merge pull request #928 from Lazar-T/patch-1 (commit b415d04)
- comma instead of fullstop (commit 627b9ba)
- Merge pull request #885 from jsma/patch-1 (commit de909ad)
- Update request-response.rst (commit 3f3263d)
- SgmlLinkExtractor - fix for parsing <area> tag with Unicode present (commit 49b40f0)

7.1.66 Scrapy 0.24.4 (2014-08-09)

- pem file is used by mockserver and required by scrapy bench (commit 5eddc68b63)
- scrapy bench needs scrapy.tests* (commit d6cb999)

7.1.67 Scrapy 0.24.3 (2014-08-09)

- no need to waste travis-ci time on py3 for 0.24 (commit 8e080c1)
- Update installation docs (commit 1d0c096)
- There is a trove classifier for Scrapy framework! (commit 4c701d7)
- update other places where w3lib version is mentioned (commit d109c13)
- Update w3lib requirement to 1.8.0 (commit 39d2ce5)
- Use w3lib.html.replace_entities() (remove_entities() is deprecated) (commit 180d3ad)
- set zip_safe=False (commit a51ee8b)
- do not ship tests package (commit ee3b371)
- scrapy.bat is not needed anymore (commit c3861cf)
- Modernize setup.py (commit 362e322)
- headers can not handle non-string values (commit 94a5c65)
- fix ftp test cases (commit a274a7f)
- The sum up of travis-ci builds are taking like 50min to complete (commit ae1e2cc)
- Update shell.rst typo (commit e49c96a)
- removes weird indentation in the shell results (commit 1ca489d)
- improved explanations, clarified blog post as source, added link for XPath string functions in the spec (commit 65c8f05)
- renamed UserTimeoutError and ServerTimeouterror #583 (commit 037f6ab)
- adding some xpath tips to selectors docs (commit 2d103e0)
- fix tests to account for https://github.com/scrapy/w3lib/pull/23 (commit f8d366a)
- get_func_args maximum recursion fix #728 (commit 81344ea)
- Updated input/output processor example according to #560. (commit f7c4ea8)
- Fixed Python syntax in tutorial. (commit db59ed9)
- Add test case for tunneling proxy (commit f090260)
- Bugfix for leaking Proxy-Authorization header to remote host when using tunneling (commit d8793af)
- Extract links from XHTML documents with MIME-Type "application/xml" (commit ed1f376)
- Merge pull request #793 from roysc/patch-1 (commit 91a1106)
- Fix typo in commands.rst (commit 743e1e2)
- better testcase for settings.overrides.setdefault (commit e22daaf)
- Using CRLF as line marker according to http 1.1 definition (commit 5ec430b)

7.1.68 Scrapy 0.24.2 (2014-07-08)

- Use a mutable mapping to proxy deprecated settings.overrides and settings.defaults attribute (commit e5e8133)
- there is not support for python3 yet (commit 3cd6146)
- Update python compatible version set to Debian packages (commit fa5d76b)
- DOC fix formatting in release notes (commit c6a9e20)

7.1.69 Scrapy 0.24.1 (2014-06-27)

- Fix deprecated CrawlerSettings and increase backward compatibility with .defaults attribute (commit 8e3f20a)

7.1.70 Scrapy 0.24.0 (2014-06-26)

Enhancements

- Improve Scrapy top-level namespace (issue 494, issue 684)
- Add selector shortcuts to responses (issue 554, issue 690)
- Add new lxml based LinkExtractor to replace unmaintained SgmlLinkExtractor (issue 559, issue 761, issue 763)
- Cleanup settings API - part of per-spider settings **GSoC project** (issue 737)
- Add UTF8 encoding header to templates (issue 688, issue 762)
- Telnet console now binds to 127.0.0.1 by default (issue 699)
- Update Debian/Ubuntu install instructions (issue 509, issue 549)
- Disable smart strings in lxml XPath evaluations (issue 535)
- Restore filesystem based cache as default for http cache middleware (issue 541, issue 500, issue 571)
- Expose current crawler in Scrapy shell (issue 557)
- Improve testsuite comparing CSV and XML exporters (issue 570)
- New `offsite/filtered` and `offsite/domains` stats (issue 566)
- Support process_links as generator in CrawlSpider (issue 555)
- Verbose logging and new stats counters for DupeFilter (issue 553)
- Add a mimetype parameter to `MailSender.send()` (issue 602)
- Generalize file pipeline log messages (issue 622)
- Replace unencodeable codepoints with html entities in SGMLLinkExtractor (issue 565)
- Converted SEP documents to rst format (issue 629, issue 630, issue 638, issue 632, issue 636, issue 640, issue 635, issue 634, issue 639, issue 637, issue 631, issue 633, issue 641, issue 642)
- Tests and docs for clickdata's nr index in FormRequest (issue 646, issue 645)
- Allow to disable a downloader handler just like any other component (issue 650)
- Log when a request is discarded after too many redirections (issue 654)
- Log error responses if they are not handled by spider callbacks (issue 612, issue 656)
- Add content-type check to http compression mw (issue 193, issue 660)
- Run pypy tests using latest pypi from ppa (issue 674)
- Run test suite using pytest instead of trial (issue 679)

- Build docs and check for dead links in tox environment (issue 687)
- Make scrapy.version_info a tuple of integers (issue 681, issue 692)
- Infer exporter's output format from filename extensions (issue 546, issue 659, issue 760)
- Support case-insensitive domains in `url_is_from_any_domain()` (issue 693)
- Remove pep8 warnings in project and spider templates (issue 698)
- Tests and docs for `request_fingerprint` function (issue 597)
- Update SEP-19 for GSoC project `per-spider settings` (issue 705)
- Set exit code to non-zero when contracts fails (issue 727)
- Add a setting to control what class is instantiated as Downloader component (issue 738)
- Pass response in `item_dropped` signal (issue 724)
- Improve `scrapy check` contracts command (issue 733, issue 752)
- Document `spider.closed()` shortcut (issue 719)
- Document `request_scheduled` signal (issue 746)
- Add a note about reporting security issues (issue 697)
- Add LevelDB http cache storage backend (issue 626, issue 500)
- Sort spider list output of `scrapy list` command (issue 742)
- Multiple documentation enhancements and fixes (issue 575, issue 587, issue 590, issue 596, issue 610, issue 617, issue 618, issue 627, issue 613, issue 643, issue 654, issue 675, issue 663, issue 711, issue 714)

Bugfixes

- Encode unicode URL value when creating Links in RegexLinkExtractor (issue 561)
- Ignore None values in ItemLoader processors (issue 556)
- Fix link text when there is an inner tag in SGMLLinkExtractor and HtmlParserLinkExtractor (issue 485, issue 574)
- Fix wrong checks on subclassing of deprecated classes (issue 581, issue 584)
- Handle errors caused by inspect.stack() failures (issue 582)
- Fix a reference to unexistent engine attribute (issue 593, issue 594)
- Fix dynamic itemclass example usage of type() (issue 603)
- Use lucasdemarchi/codespell to fix typos (issue 628)
- Fix default value of attrs argument in SgmlLinkExtractor to be tuple (issue 661)
- Fix XXE flaw in sitemap reader (issue 676)
- Fix engine to support filtered start requests (issue 707)
- Fix offsite middleware case on urls with no hostnames (issue 745)
- Testsuite doesn't require PIL anymore (issue 585)

7.1.71 Scrapy 0.22.2 (released 2014-02-14)

- fix a reference to unexistent engine.slots. closes #593 (commit 13c099a)
- downloaderMW doc typo (spiderMW doc copy remnant) (commit 8ae11bf)
- Correct typos (commit 1346037)

7.1.72 Scrapy 0.22.1 (released 2014-02-08)

- localhost666 can resolve under certain circumstances (commit 2ec2279)
- test inspect.stack failure (commit cc3eda3)
- Handle cases when inspect.stack() fails (commit 8cb44f9)
- Fix wrong checks on subclassing of deprecated classes. closes #581 (commit 46d98d6)
- Docs: 4-space indent for final spider example (commit 13846de)
- Fix HtmlParserLinkExtractor and tests after #485 merge (commit 368a946)
- BaseSgmlLinkExtractor: Fixed the missing space when the link has an inner tag (commit b566388)
- BaseSgmlLinkExtractor: Added unit test of a link with an inner tag (commit c1cb418)
- BaseSgmlLinkExtractor: Fixed unknown_endtag() so that it only set current_link=None when the end tag match the opening tag (commit 7e4d627)
- Fix tests for Travis-CI build (commit 76c7e20)
- replace unencodeable codepoints with html entities. fixes #562 and #285 (commit 5f87b17)
- RegexLinkExtractor: encode URL unicode value when creating Links (commit d0ee545)
- Updated the tutorial crawl output with latest output. (commit 8da65de)
- Updated shell docs with the crawler reference and fixed the actual shell output. (commit 875b9ab)
- PEP8 minor edits. (commit f89efaf)
- Expose current crawler in the Scrapy shell. (commit 5349cec)
- Unused re import and PEP8 minor edits. (commit 387f414)
- Ignore None's values when using the ItemLoader. (commit 0632546)
- DOC Fixed HTTPCACHE_STORAGE typo in the default value which is now Filesystem instead Dbm. (commit cde9a8c)
- show Ubuntu setup instructions as literal code (commit fb5c9c5)
- Update Ubuntu installation instructions (commit 70fb105)
- Merge pull request #550 from stray-leone/patch-1 (commit 6f70b6a)
- modify the version of Scrapy Ubuntu package (commit 725900d)
- fix 0.22.0 release date (commit af0219a)
- fix typos in news.rst and remove (not released yet) header (commit b7f58f4)

7.1.73 Scrapy 0.22.0 (released 2014-01-17)

Enhancements

- [**Backward incompatible**] Switched HTTPCacheMiddleware backend to filesystem (issue 541) To restore old backend set `HTTPCACHE_STORAGE` to `scrapy.contrib.httpcache.DbmCacheStorage`

- Proxy https:// urls using CONNECT method (issue 392, issue 397)
- Add a middleware to crawl ajax crawlable pages as defined by google (issue 343)
- Rename scrapy.spider.BaseSpider to scrapy.spider.Spider (issue 510, issue 519)
- Selectors register EXSLT namespaces by default (issue 472)
- Unify item loaders similar to selectors renaming (issue 461)
- Make `RFPDupeFilter` class easily subclassable (issue 533)
- Improve test coverage and forthcoming Python 3 support (issue 525)
- Promote startup info on settings and middleware to INFO level (issue 520)
- Support partials in `get_func_args` util (issue 506, issue:*504*)
- Allow running individual tests via tox (issue 503)
- Update extensions ignored by link extractors (issue 498)
- Add middleware methods to get files/images/thumbs paths (issue 490)
- Improve offsite middleware tests (issue 478)
- Add a way to skip default Referer header set by RefererMiddleware (issue 475)
- Do not send `x-gzip` in default `Accept-Encoding` header (issue 469)
- Support defining http error handling using settings (issue 466)
- Use modern python idioms wherever you find legacies (issue 497)
- Improve and correct documentation (issue 527, issue 524, issue 521, issue 517, issue 512, issue 505, issue 502, issue 489, issue 465, issue 460, issue 425, issue 536)

Fixes

- Update Selector class imports in CrawlSpider template (issue 484)
- Fix unexistent reference to `engine.slots` (issue 464)
- Do not try to call `body_as_unicode()` on a non-TextResponse instance (issue 462)
- Warn when subclassing XPathItemLoader, previously it only warned on instantiation. (issue 523)
- Warn when subclassing XPathSelector, previously it only warned on instantiation. (issue 537)
- Multiple fixes to memory stats (issue 531, issue 530, issue 529)
- Fix overriding url in `FormRequest.from_response()` (issue 507)
- Fix tests runner under pip 1.5 (issue 513)
- Fix logging error when spider name is unicode (issue 479)

7.1.74 Scrapy 0.20.2 (released 2013-12-09)

- Update CrawlSpider Template with Selector changes (commit 6d1457d)
- fix method name in tutorial. closes GH-480 (commit b4fc359

7.1.75 Scrapy 0.20.1 (released 2013-11-28)

- include_package_data is required to build wheels from published sources (commit 5ba1ad5)
- process_parallel was leaking the failures on its internal deferreds. closes #458 (commit 419a780)

7.1.76 Scrapy 0.20.0 (released 2013-11-08)

Enhancements

- New Selector's API including CSS selectors (issue 395 and issue 426),
- Request/Response url/body attributes are now immutable (modifying them had been deprecated for a long time)
- *ITEM_PIPELINES* is now defined as a dict (instead of a list)
- Sitemap spider can fetch alternate URLs (issue 360)
- `Selector.remove_namespaces()` now remove namespaces from element's attributes. (issue 416)
- Paved the road for Python 3.3+ (issue 435, issue 436, issue 431, issue 452)
- New item exporter using native python types with nesting support (issue 366)
- Tune HTTP1.1 pool size so it matches concurrency defined by settings (commit b43b5f575)
- scrapy.mail.MailSender now can connect over TLS or upgrade using STARTTLS (issue 327)
- New FilesPipeline with functionality factored out from ImagesPipeline (issue 370, issue 409)
- Recommend Pillow instead of PIL for image handling (issue 317)
- Added Debian packages for Ubuntu Quantal and Raring (commit 86230c0)
- Mock server (used for tests) can listen for HTTPS requests (issue 410)
- Remove multi spider support from multiple core components (issue 422, issue 421, issue 420, issue 419, issue 423, issue 418)
- Travis-CI now tests Scrapy changes against development versions of `w3lib` and `queuelib` python packages.
- Add pypy 2.1 to continuous integration tests (commit ecfa7431)
- Pylinted, pep8 and removed old-style exceptions from source (issue 430, issue 432)
- Use importlib for parametric imports (issue 445)
- Handle a regression introduced in Python 2.7.5 that affects XmlItemExporter (issue 372)
- Bugfix crawling shutdown on SIGINT (issue 450)
- Do not submit `reset` type inputs in FormRequest.from_response (commit b326b87)
- Do not silence download errors when request errback raises an exception (commit 684cfc0)

Bugfixes

- Fix tests under Django 1.6 (commit b6bed44c)
- Lot of bugfixes to retry middleware under disconnections using HTTP 1.1 download handler
- Fix inconsistencies among Twisted releases (issue 406)
- Fix Scrapy shell bugs (issue 418, issue 407)
- Fix invalid variable name in setup.py (issue 429)
- Fix tutorial references (issue 387)

- Improve request-response docs (issue 391)
- Improve best practices docs (issue 399, issue 400, issue 401, issue 402)
- Improve django integration docs (issue 404)
- Document `bindaddress` request meta (commit 37c24e01d7)
- Improve `Request` class documentation (issue 226)

Other

- Dropped Python 2.6 support (issue 448)
- Add cssselect python package as install dependency
- Drop libxml2 and multi selector's backend support, lxml is required from now on.
- Minimum Twisted version increased to 10.0.0, dropped Twisted 8.0 support.
- Running test suite now requires `mock` python library (issue 390)

Thanks

Thanks to everyone who contribute to this release!

7.1.77 Scrapy 0.18.4 (released 2013-10-10)

- IPython refuses to update the namespace. fix #396 (commit 3d32c4f)
- Fix AlreadyCalledError replacing a request in shell command. closes #407 (commit b1d8919)
- Fix `start_requests()` laziness and early hangs (commit 89faf52)

7.1.78 Scrapy 0.18.3 (released 2013-10-03)

- fix regression on lazy evaluation of start requests (commit 12693a5)
- forms: do not submit reset inputs (commit e429f63)
- increase unittest timeouts to decrease travis false positive failures (commit 912202e)
- backport master fixes to json exporter (commit cfc2d46)
- Fix permission and set umask before generating sdist tarball (commit 06149e0)

7.1.79 Scrapy 0.18.2 (released 2013-09-03)

- Backport `scrapy check` command fixes and backward compatible multi crawler process(issue 339)

7.1.80 Scrapy 0.18.1 (released 2013-08-27)

- remove extra import added by cherry picked changes (commit d20304e)
- fix crawling tests under twisted pre 11.0.0 (commit 1994f38)
- py26 can not format zero length fields {} (commit abf756f)
- test PotentiaDataLoss errors on unbound responses (commit b15470d)
- Treat responses without content-length or Transfer-Encoding as good responses (commit c4bf324)
- do no include ResponseFailed if http11 handler is not enabled (commit 6cbe684)
- New HTTP client wraps connection lost in ResponseFailed exception. fix #373 (commit 1a20bba)
- limit travis-ci build matrix (commit 3b01bb8)
- Merge pull request #375 from peterarenot/patch-1 (commit fa766d7)
- Fixed so it refers to the correct folder (commit 3283809)
- added Quantal & Raring to support Ubuntu releases (commit 1411923)
- fix retry middleware which didn't retry certain connection errors after the upgrade to http1 client, closes GH-373 (commit bb35ed0)
- fix XmlItemExporter in Python 2.7.4 and 2.7.5 (commit de3e451)
- minor updates to 0.18 release notes (commit c45e5f1)
- fix contributors list format (commit 0b60031)

7.1.81 Scrapy 0.18.0 (released 2013-08-09)

- Lot of improvements to testsuite run using Tox, including a way to test on pypi
- Handle GET parameters for AJAX crawlable urls (commit 3fe2a32)
- Use lxml recover option to parse sitemaps (issue 347)
- Bugfix cookie merging by hostname and not by netloc (issue 352)
- Support disabling `HttpCompressionMiddleware` using a flag setting (issue 359)
- Support xml namespaces using `iternodes` parser in `XMLFeedSpider` (issue 12)
- Support `dont_cache` request meta flag (issue 19)
- Bugfix `scrapy.utils.gz.gunzip` broken by changes in python 2.7.4 (commit 4dc76e)
- Bugfix url encoding on `SgmlLinkExtractor` (issue 24)

- Bugfix `TakeFirst` processor shouldn't discard zero (0) value (issue 59)
- Support nested items in xml exporter (issue 66)
- Improve cookies handling performance (issue 77)
- Log dupe filtered requests once (issue 105)
- Split redirection middleware into status and meta based middlewares (issue 78)
- Use HTTP1.1 as default downloader handler (issue 109 and issue 318)
- Support xpath form selection on `FormRequest.from_response` (issue 185)
- Bugfix unicode decoding error on `SgmlLinkExtractor` (issue 199)
- Bugfix signal dispatching on pypi interpreter (issue 205)
- Improve request delay and concurrency handling (issue 206)
- Add RFC2616 cache policy to `HttpCacheMiddleware` (issue 212)
- Allow customization of messages logged by engine (issue 214)
- Multiples improvements to `DjangoItem` (issue 217, issue 218, issue 221)
- Extend Scrapy commands using setuptools entry points (issue 260)
- Allow spider `allowed_domains` value to be set/tuple (issue 261)
- Support `settings.getdict` (issue 269)
- Simplify internal `scrapy.core.scraper` slot handling (issue 271)
- Added `Item.copy` (issue 290)
- Collect idle downloader slots (issue 297)
- Add `ftp://` scheme downloader handler (issue 329)
- Added downloader benchmark webserver and spider tools *Benchmarking*
- Moved persistent (on disk) queues to a separate project (queuelib) which Scrapy now depends on
- Add Scrapy commands using external libraries (issue 260)
- Added `--pdb` option to `scrapy` command line tool
- Added *`XPathSelector.remove_namespaces`* which allows to remove all namespaces from XML documents for convenience (to work with namespace-less XPaths). Documented in *Selectors*.
- Several improvements to spider contracts
- New default middleware named MetaRefreshMiddleware that handles meta-refresh html tag redirections,
- MetaRefreshMiddleware and RedirectMiddleware have different priorities to address #62
- added from_crawler method to spiders
- added system tests with mock server
- more improvements to macOS compatibility (thanks Alex Cepoi)
- several more cleanups to singletons and multi-spider support (thanks Nicolas Ramirez)
- support custom download slots
- added –spider option to "shell" command.
- log overridden settings when Scrapy starts

Thanks to everyone who contribute to this release. Here is a list of contributors sorted by number of commits:

```

7.1.82 Scrapy 0.16.5 (released 2013-05-30)

- obey request method when Scrapy deploy is redirected to a new endpoint (commit 8c4fcee)
- fix inaccurate downloader middleware documentation. refs #280 (commit 40667cb)
- doc: remove links to diveintopython.org, which is no longer available. closes #246 (commit bd58bfa)
- Find form nodes in invalid html5 documents (commit e3d6945)
- Fix typo labeling attrs type bool instead of list (commit a274276)

7.1.83 Scrapy 0.16.4 (released 2013-01-23)

- fixes spelling errors in documentation (commit 6d2b3aa)
- add doc about disabling an extension. refs #132 (commit c90de33)
- Fixed error message formatting. log.err() doesn't support cool formatting and when error occurred, the message was: "ERROR: Error processing %(item)s" (commit c16150c)
- lint and improve images pipeline error logging (commit 56b45fc)
- fixed doc typos (commit 243be84)
- add documentation topics: Broad Crawls & Common Practices (commit 1fbb715)
- fix bug in Scrapy parse command when spider is not specified explicitly. closes #209 (commit c72e682)
- Update docs/topics/commands.rst (commit 28eac7a)

7.1.84 Scrapy 0.16.3 (released 2012-12-07)

- Remove concurrency limitation when using download delays and still ensure inter-request delays are enforced (commit 487b9b5)
- add error details when image pipeline fails (commit 8232569)
- improve macOS compatibility (commit 8dcf8aa)
- setup.py: use README.rst to populate long_description (commit 7b5310d)
- doc: removed obsolete references to ClientForm (commit 80f9bb6)
- correct docs for default storage backend (commit 2aa491b)
- doc: removed broken proxyhub link from FAQ (commit bdf61c4)
- Fixed docs typo in SpiderOpenCloseLogging example (commit 7184094)

7.1.85 Scrapy 0.16.2 (released 2012-11-09)

- Scrapy contracts: python2.6 compat (commit a4a9199)
- Scrapy contracts verbose option (commit ec41673)
- proper unittest-like output for Scrapy contracts (commit 86635e4)
- added open_in_browser to debugging doc (commit c9b690d)
- removed reference to global Scrapy stats from settings doc (commit dd55067)
- Fix SpiderState bug in Windows platforms (commit 58998f4)

7.1.86 Scrapy 0.16.1 (released 2012-10-26)

- fixed LogStats extension, which got broken after a wrong merge before the 0.16 release (commit 8c780fd)
- better backward compatibility for scrapy.conf.settings (commit 3403089)
- extended documentation on how to access crawler stats from extensions (commit c4da0b5)
- removed .hgtags (no longer needed now that Scrapy uses git) (commit d52c188)
- fix dashes under rst headers (commit fa4f7f9)
- set release date for 0.16.0 in news (commit e292246)

7.1.87 Scrapy 0.16.0 (released 2012-10-18)

Scrapy changes:

- added *Spiders Contracts*, a mechanism for testing spiders in a formal/reproducible way
- added options `-o` and `-t` to the *runspider* command
- documented *AutoThrottle extension* and added to extensions installed by default. You still need to enable it with *AUTOTHROTTLE_ENABLED*
- major Stats Collection refactoring: removed separation of global/per-spider stats, removed stats-related signals (`stats_spider_opened`, etc). Stats are much simpler now, backward compatibility is kept on the Stats Collector API and signals.
- added a `process_start_requests()` method to spider middlewares
- dropped Signals singleton. Signals should now be accessed through the Crawler.signals attribute. See the signals documentation for more info.
- dropped Stats Collector singleton. Stats can now be accessed through the Crawler.stats attribute. See the stats collection documentation for more info.
- documented *Core API*
- `lxml` is now the default selectors backend instead of `libxml2`
- ported FormRequest.from_response() to use lxml instead of ClientForm
- removed modules: `scrapy.xlib.BeautifulSoup` and `scrapy.xlib.ClientForm`
- SitemapSpider: added support for sitemap urls ending in .xml and .xml.gz, even if they advertise a wrong content type (commit 10ed28b)
- StackTraceDump extension: also dump trackref live references (commit fe2ce93)
- nested items now fully supported in JSON and JSONLines exporters
- added *cookiejar* Request meta key to support multiple cookie sessions per spider
- decoupled encoding detection code to w3lib.encoding, and ported Scrapy code to use that module
- dropped support for Python 2.5. See https://www.zyte.com/blog/scrapy-0-15-dropping-support-for-python-2-5/
- dropped support for Twisted 2.5
- added *REFERER_ENABLED* setting, to control referer middleware
- changed default user agent to: `Scrapy/VERSION (+http://scrapy.org)`
- removed (undocumented) `HTMLImageLinkExtractor` class from `scrapy.contrib.linkextractors.image`
- removed per-spider settings (to be replaced by instantiating multiple crawler objects)
- `USER_AGENT` spider attribute will no longer work, use `user_agent` attribute instead
- `DOWNLOAD_TIMEOUT` spider attribute will no longer work, use `download_timeout` attribute instead
- removed `ENCODING_ALIASES` setting, as encoding auto-detection has been moved to the w3lib library
- promoted topics-djangoitem to main contrib
- LogFormatter method now return dicts(instead of strings) to support lazy formatting (issue 164, commit dcef7b0)
- downloader handlers (*DOWNLOAD_HANDLERS* setting) now receive settings as the first argument of the `__init__` method

- replaced memory usage accounting with (more portable) resource module, removed `scrapy.utils.memory` module
- removed signal: `scrapy.mail.mail_sent`
- removed `TRACK_REFS` setting, now *trackrefs* is always enabled
- DBM is now the default storage backend for HTTP cache middleware
- number of log messages (per level) are now tracked through Scrapy stats (stat name: `log_count/LEVEL`)
- number received responses are now tracked through Scrapy stats (stat name: `response_received_count`)
- removed `scrapy.log.started` attribute

7.1.88 Scrapy 0.14.4

- added precise to supported Ubuntu distros (commit b7e46df)
- fixed bug in json-rpc webservice reported in https://groups.google.com/forum/#!topic/scrapy-users/qgVBmFybNAQ/discussion. also removed no longer supported 'run' command from extras/scrapy-ws.py (commit 340fbdb)
- meta tag attributes for content-type http equiv can be in any order. #123 (commit 0cb68af)
- replace "import Image" by more standard "from PIL import Image". closes #88 (commit 4d17048)
- return trial status as bin/runtests.sh exit value. #118 (commit b7b2e7f)

7.1.89 Scrapy 0.14.3

- forgot to include pydispatch license. #118 (commit fd85f9c)
- include egg files used by testsuite in source distribution. #118 (commit c897793)
- update docstring in project template to avoid confusion with genspider command, which may be considered as an advanced feature. refs #107 (commit 2548dcc)
- added note to docs/topics/firebug.rst about google directory being shut down (commit 668e352)
- don't discard slot when empty, just save in another dict in order to recycle if needed again. (commit 8e9f607)
- do not fail handling unicode xpaths in libxml2 backed selectors (commit b830e95)
- fixed minor mistake in Request objects documentation (commit bf3c9ee)
- fixed minor defect in link extractors documentation (commit ba14f38)
- removed some obsolete remaining code related to sqlite support in Scrapy (commit 0665175)

7.1.90 Scrapy 0.14.2

- move buffer pointing to start of file before computing checksum. refs #92 (commit 6a5bef2)
- Compute image checksum before persisting images. closes #92 (commit 9817df1)
- remove leaking references in cached failures (commit 673a120)
- fixed bug in MemoryUsage extension: get_engine_status() takes exactly 1 argument (0 given) (commit 11133e9)
- fixed struct.error on http compression middleware. closes #87 (commit 1423140)
- ajax crawling wasn't expanding for unicode urls (commit 0de3fb4)
- Catch `start_requests()` iterator errors. refs #83 (commit 454a21d)
- Speed-up libxml2 XPathSelector (commit 2fbd662)

- updated versioning doc according to recent changes (commit 0a070f5)
- scrapyd: fixed documentation link (commit 2b4e4c3)
- extras/makedeb.py: no longer obtaining version from git (commit caffe0e)

7.1.91 Scrapy 0.14.1

- extras/makedeb.py: no longer obtaining version from git (commit caffe0e)
- bumped version to 0.14.1 (commit 6cb9e1c)
- fixed reference to tutorial directory (commit 4b86bd6)
- doc: removed duplicated callback argument from Request.replace() (commit 1aeccdd)
- fixed formatting of scrapyd doc (commit 8bf19e6)
- Dump stacks for all running threads and fix engine status dumped by StackTraceDump extension (commit 14a8e6e)
- added comment about why we disable ssl on boto images upload (commit 5223575)
- SSL handshaking hangs when doing too many parallel connections to S3 (commit 63d583d)
- change tutorial to follow changes on dmoz site (commit bcb3198)
- Avoid _disconnectedDeferred AttributeError exception in Twisted>=11.1.0 (commit 98f3f87)
- allow spider to set autothrottle max concurrency (commit 175a4b5)

7.1.92 Scrapy 0.14

New features and settings

- Support for AJAX crawlable urls
- New persistent scheduler that stores requests on disk, allowing to suspend and resume crawls (r2737)
- added `-o` option to `scrapy crawl`, a shortcut for dumping scraped items into a file (or standard output using `-`)
- Added support for passing custom settings to Scrapyd `schedule.json` api (r2779, r2783)
- New `ChunkedTransferMiddleware` (enabled by default) to support chunked transfer encoding (r2769)
- Add boto 2.0 support for S3 downloader handler (r2763)
- Added marshal to formats supported by feed exports (r2744)
- In request errbacks, offending requests are now received in `failure.request` attribute (r2738)
- **Big downloader refactoring to support per domain/ip concurrency limits (r2732)**
  - **`CONCURRENT_REQUESTS_PER_SPIDER` setting has been deprecated and replaced by:**
    - *`CONCURRENT_REQUESTS`*, *`CONCURRENT_REQUESTS_PER_DOMAIN`*, *`CONCURRENT_REQUESTS_PER_IP`*
  - check the documentation for more details
- Added builtin caching DNS resolver (r2728)
- Moved Amazon AWS-related components/extensions (SQS spider queue, SimpleDB stats collector) to a separate project: [scaws](https://github.com/scrapinghub/scaws) (r2706, r2714)
- Moved spider queues to scrapyd: `scrapy.spiderqueue` -> `scrapyd.spiderqueue` (r2708)
- Moved sqlite utils to scrapyd: `scrapy.utils.sqlite` -> `scrapyd.sqlite` (r2781)

- Real support for returning iterators on `start_requests()` method. The iterator is now consumed during the crawl when the spider is getting idle (r2704)
- Added *REDIRECT_ENABLED* setting to quickly enable/disable the redirect middleware (r2697)
- Added *RETRY_ENABLED* setting to quickly enable/disable the retry middleware (r2694)
- Added `CloseSpider` exception to manually close spiders (r2691)
- Improved encoding detection by adding support for HTML5 meta charset declaration (r2690)
- Refactored close spider behavior to wait for all downloads to finish and be processed by spiders, before closing the spider (r2688)
- Added `SitemapSpider` (see documentation in Spiders page) (r2658)
- Added `LogStats` extension for periodically logging basic stats (like crawled pages and scraped items) (r2657)
- Make handling of gzipped responses more robust (#319, r2643). Now Scrapy will try and decompress as much as possible from a gzipped response, instead of failing with an `IOError`.
- Simplified !MemoryDebugger extension to use stats for dumping memory debugging info (r2639)
- Added new command to edit spiders: `scrapy edit` (r2636) and `-e` flag to `genspider` command that uses it (r2653)
- Changed default representation of items to pretty-printed dicts. (r2631). This improves default logging by making log more readable in the default case, for both Scraped and Dropped lines.
- Added *spider_error* signal (r2628)
- Added *COOKIES_ENABLED* setting (r2625)
- Stats are now dumped to Scrapy log (default value of *STATS_DUMP* setting has been changed to `True`). This is to make Scrapy users more aware of Scrapy stats and the data that is collected there.
- Added support for dynamically adjusting download delay and maximum concurrent requests (r2599)
- Added new DBM HTTP cache storage backend (r2576)
- Added `listjobs.json` API to Scrapyd (r2571)
- `CsvItemExporter`: added `join_multivalued` parameter (r2578)
- Added namespace support to `xmliter_lxml` (r2552)
- Improved cookies middleware by making `COOKIES_DEBUG` nicer and documenting it (r2579)
- Several improvements to Scrapyd and Link extractors

Code rearranged and removed

- **Merged item passed and item scraped concepts, as they have often proved confusing in the past. This means: (r2630)**
  - original item_scraped signal was removed
  - original item_passed signal was renamed to item_scraped
  - old log lines `Scraped Item...` were removed
  - old log lines `Passed Item...` were renamed to `Scraped Item...` lines and downgraded to `DEBUG` level
- **Reduced Scrapy codebase by striping part of Scrapy code into two new libraries:**
  - w3lib (several functions from `scrapy.utils.{http,markup,multipart,response,url}`, done in r2584)

  - scrapely (was `scrapy.contrib.ibl`, done in r2586)

- Removed unused function: `scrapy.utils.request.request_info()` (r2577)
- Removed googledir project from `examples/googledir`. There's now a new example project called `dirbot` available on GitHub: https://github.com/scrapy/dirbot
- Removed support for default field values in Scrapy items (r2616)
- Removed experimental crawlspider v2 (r2632)
- Removed scheduler middleware to simplify architecture. Duplicates filter is now done in the scheduler itself, using the same dupe filtering class as before (`DUPEFILTER_CLASS` setting) (r2640)
- Removed support for passing urls to `scrapy crawl` command (use `scrapy parse` instead) (r2704)
- Removed deprecated Execution Queue (r2704)
- Removed (undocumented) spider context extension (from scrapy.contrib.spidercontext) (r2780)
- removed `CONCURRENT_SPIDERS` setting (use scrapyd maxproc instead) (r2789)
- Renamed attributes of core components: downloader.sites -> downloader.slots, scraper.sites -> scraper.slots (r2717, r2718)
- Renamed setting `CLOSESPIDER_ITEMPASSED` to *CLOSESPIDER_ITEMCOUNT* (r2655). Backward compatibility kept.

7.1.93 Scrapy 0.12

The numbers like #NNN reference tickets in the old issue tracker (Trac) which is no longer available.

New features and improvements

- Passed item is now sent in the `item` argument of the *item_passed* (#273)
- Added verbose option to `scrapy version` command, useful for bug reports (#298)
- HTTP cache now stored by default in the project data dir (#279)
- Added project data storage directory (#276, #277)
- Documented file structure of Scrapy projects (see command-line tool doc)
- New lxml backend for XPath selectors (#147)
- Per-spider settings (#245)
- Support exit codes to signal errors in Scrapy commands (#248)
- Added `-c` argument to `scrapy shell` command
- Made `libxml2` optional (#260)
- New `deploy` command (#261)
- Added *CLOSESPIDER_PAGECOUNT* setting (#253)
- Added *CLOSESPIDER_ERRORCOUNT* setting (#254)

Scrapyd changes

- Scrapyd now uses one process per spider
- It stores one log file per spider run, and rotate them keeping the latest 5 logs per spider (by default)
- A minimal web ui was added, available at http://localhost:6800 by default

- There is now a `scrapy server` command to start a Scrapyd server of the current project

Changes to settings

- added `HTTPCACHE_ENABLED` setting (False by default) to enable HTTP cache middleware
- changed `HTTPCACHE_EXPIRATION_SECS` semantics: now zero means "never expire".

Deprecated/obsoleted functionality

- Deprecated `runserver` command in favor of `server` command which starts a Scrapyd server. See also: Scrapyd changes
- Deprecated `queue` command in favor of using Scrapyd `schedule.json` API. See also: Scrapyd changes
- Removed the !LxmlItemLoader (experimental contrib which never graduated to main contrib)

7.1.94 Scrapy 0.10

The numbers like #NNN reference tickets in the old issue tracker (Trac) which is no longer available.

New features and improvements

- New Scrapy service called `scrapyd` for deploying Scrapy crawlers in production (#218) (documentation available)
- Simplified Images pipeline usage which doesn't require subclassing your own images pipeline now (#217)
- Scrapy shell now shows the Scrapy log by default (#206)
- Refactored execution queue in a common base code and pluggable backends called "spider queues" (#220)
- New persistent spider queue (based on SQLite) (#198), available by default, which allows to start Scrapy in server mode and then schedule spiders to run.
- Added documentation for Scrapy command-line tool and all its available sub-commands. (documentation available)
- Feed exporters with pluggable backends (#197) (documentation available)
- Deferred signals (#193)
- Added two new methods to item pipeline open_spider(), close_spider() with deferred support (#195)
- Support for overriding default request headers per spider (#181)
- Replaced default Spider Manager with one with similar functionality but not depending on Twisted Plugins (#186)
- Split Debian package into two packages - the library and the service (#187)
- Scrapy log refactoring (#188)
- New extension for keeping persistent spider contexts among different runs (#203)
- Added `dont_redirect` request.meta key for avoiding redirects (#233)
- Added `dont_retry` request.meta key for avoiding retries (#234)

Command-line tool changes

- New `scrapy` command which replaces the old `scrapy-ctl.py` (#199) - there is only one global `scrapy` command now, instead of one `scrapy-ctl.py` per project - Added `scrapy.bat` script for running more conveniently from Windows
- Added bash completion to command-line tool (#210)
- Renamed command `start` to `runserver` (#209)

API changes

- `url` and `body` attributes of Request objects are now read-only (#230)
- `Request.copy()` and `Request.replace()` now also copies their `callback` and `errback` attributes (#231)
- Removed `UrlFilterMiddleware` from `scrapy.contrib` (already disabled by default)
- Offsite middleware doesn't filter out any request coming from a spider that doesn't have a allowed_domains attribute (#225)
- Removed Spider Manager `load()` method. Now spiders are loaded in the `__init__` method itself.
- **Changes to Scrapy Manager (now called "Crawler"):**
  - `scrapy.core.manager.ScrapyManager` class renamed to `scrapy.crawler.Crawler`
  - `scrapy.core.manager.scrapymanager` singleton moved to `scrapy.project.crawler`
- Moved module: `scrapy.contrib.spidermanager` to `scrapy.spidermanager`
- Spider Manager singleton moved from `scrapy.spider.spiders` to the `spiders` attribute of `scrapy.project.crawler` singleton.
- **moved Stats Collector classes: (#204)**
  - `scrapy.stats.collector.StatsCollector` to `scrapy.statscol.StatsCollector`
  - `scrapy.stats.collector.SimpledbStatsCollector` to `scrapy.contrib.statscol.SimpledbStatsCollector`
- default per-command settings are now specified in the `default_settings` attribute of command object class (#201)
- **changed arguments of Item pipeline `process_item()` method from `(spider, item)` to `(item, spider)`**
  - backward compatibility kept (with deprecation warning)
- **moved `scrapy.core.signals` module to `scrapy.signals`**
  - backward compatibility kept (with deprecation warning)
- **moved `scrapy.core.exceptions` module to `scrapy.exceptions`**
  - backward compatibility kept (with deprecation warning)
- added `handles_request()` class method to `BaseSpider`
- dropped `scrapy.log.exc()` function (use `scrapy.log.err()` instead)
- dropped `component` argument of `scrapy.log.msg()` function
- dropped `scrapy.log.log_level` attribute
- Added `from_settings()` class methods to Spider Manager, and Item Pipeline Manager

Changes to settings

- Added `HTTPCACHE_IGNORE_SCHEMES` setting to ignore certain schemes on !HttpCacheMiddleware (#225)
- Added `SPIDER_QUEUE_CLASS` setting which defines the spider queue to use (#220)
- Added `KEEP_ALIVE` setting (#220)
- Removed `SERVICE_QUEUE` setting (#220)
- Removed `COMMANDS_SETTINGS_MODULE` setting (#201)
- Renamed `REQUEST_HANDLERS` to `DOWNLOAD_HANDLERS` and make download handlers classes (instead of functions)

7.1.95 Scrapy 0.9

The numbers like #NNN reference tickets in the old issue tracker (Trac) which is no longer available.

New features and improvements

- Added SMTP-AUTH support to scrapy.mail
- New settings added: `MAIL_USER`, `MAIL_PASS` (r2065 | #149)
- Added new scrapy-ctl view command - To view URL in the browser, as seen by Scrapy (r2039)
- Added web service for controlling Scrapy process (this also deprecates the web console. (r2053 | #167)
- Support for running Scrapy as a service, for production systems (r1988, r2054, r2055, r2056, r2057 | #168)
- Added wrapper induction library (documentation only available in source code for now). (r2011)
- Simplified and improved response encoding support (r1961, r1969)
- Added `LOG_ENCODING` setting (r1956, documentation available)
- Added `RANDOMIZE_DOWNLOAD_DELAY` setting (enabled by default) (r1923, doc available)
- `MailSender` is no longer IO-blocking (r1955 | #146)
- Linkextractors and new Crawlspider now handle relative base tag urls (r1960 | #148)
- Several improvements to Item Loaders and processors (r2022, r2023, r2024, r2025, r2026, r2027, r2028, r2029, r2030)
- Added support for adding variables to telnet console (r2047 | #165)
- Support for requests without callbacks (r2050 | #166)

API changes

- Change `Spider.domain_name` to `Spider.name` (SEP-012, r1975)
- `Response.encoding` is now the detected encoding (r1961)
- `HttpErrorMiddleware` now returns None or raises an exception (r2006 | #157)
- `scrapy.command` modules relocation (r2035, r2036, r2037)
- Added `ExecutionQueue` for feeding spiders to scrape (r2034)
- Removed `ExecutionEngine` singleton (r2039)
- Ported `S3ImagesStore` (images pipeline) to use boto and threads (r2033)
- Moved module: `scrapy.management.telnet` to `scrapy.telnet` (r2047)

Changes to default settings

- Changed default `SCHEDULER_ORDER` to `DFO` (r1939)

7.1.96 Scrapy 0.8

The numbers like #NNN reference tickets in the old issue tracker (Trac) which is no longer available.

New features

- Added DEFAULT_RESPONSE_ENCODING setting (r1809)
- Added `dont_click` argument to `FormRequest.from_response()` method (r1813, r1816)
- Added `clickdata` argument to `FormRequest.from_response()` method (r1802, r1803)
- Added support for HTTP proxies (`HttpProxyMiddleware`) (r1781, r1785)
- Offsite spider middleware now logs messages when filtering out requests (r1841)

Backward-incompatible changes

- Changed `scrapy.utils.response.get_meta_refresh()` signature (r1804)
- Removed deprecated `scrapy.item.ScrapedItem` class - use `scrapy.item.Item instead` (r1838)
- Removed deprecated `scrapy.xpath` module - use `scrapy.selector` instead. (r1836)
- Removed deprecated `core.signals.domain_open` signal - use `core.signals.domain_opened` instead (r1822)
- **`log.msg()` now receives a `spider` argument (r1822)**
  - Old domain argument has been deprecated and will be removed in 0.9. For spiders, you should always use the `spider` argument and pass spider references. If you really want to pass a string, use the `component` argument instead.
- Changed core signals `domain_opened`, `domain_closed`, `domain_idle`
- **Changed Item pipeline to use spiders instead of domains**
  - The `domain` argument of `process_item()` item pipeline method was changed to `spider`, the new signature is: `process_item(spider, item)` (r1827 | #105)
  - To quickly port your code (to work with Scrapy 0.8) just use `spider.domain_name` where you previously used `domain`.
- **Changed Stats API to use spiders instead of domains (r1849 | #113)**
  - `StatsCollector` was changed to receive spider references (instead of domains) in its methods (`set_value`, `inc_value`, etc).
  - added `StatsCollector.iter_spider_stats()` method
  - removed `StatsCollector.list_domains()` method
  - Also, Stats signals were renamed and now pass around spider references (instead of domains). Here's a summary of the changes:
  - To quickly port your code (to work with Scrapy 0.8) just use `spider.domain_name` where you previously used `domain`. `spider_stats` contains exactly the same data as `domain_stats`.
- **`CloseDomain` extension moved to `scrapy.contrib.closespider.CloseSpider` (r1833)**
  - **Its settings were also renamed:**

        * CLOSEDOMAIN_TIMEOUT to CLOSESPIDER_TIMEOUT
        * CLOSEDOMAIN_ITEMCOUNT to CLOSESPIDER_ITEMCOUNT

- Removed deprecated SCRAPYSETTINGS_MODULE environment variable - use SCRAPY_SETTINGS_MODULE instead (r1840)
- Renamed setting: REQUESTS_PER_DOMAIN to CONCURRENT_REQUESTS_PER_SPIDER (r1830, r1844)
- Renamed setting: CONCURRENT_DOMAINS to CONCURRENT_SPIDERS (r1830)
- Refactored HTTP Cache middleware
- HTTP Cache middleware has been heavily refactored, retaining the same functionality except for the domain sectorization which was removed. (r1843)
- Renamed exception: DontCloseDomain to DontCloseSpider (r1859 | #120)
- Renamed extension: DelayedCloseDomain to SpiderCloseDelay (r1861 | #121)
- Removed obsolete scrapy.utils.markup.remove_escape_chars function - use scrapy.utils.markup.replace_escape_chars instead (r1865)

7.1.97 Scrapy 0.7

First release of Scrapy.

7.2 Contributing to Scrapy

Important

Double check that you are reading the most recent version of this document at https://docs.scrapy.org/en/master/contributing.html

By participating in this project you agree to abide by the terms of our Code of Conduct. Please report unacceptable behavior to opensource@zyte.com.

There are many ways to contribute to Scrapy. Here are some of them:

- Report bugs and request features in the issue tracker, trying to follow the guidelines detailed in *Reporting bugs* below.
- Submit patches for new functionalities and/or bug fixes. Please read *Writing patches* and *Submitting patches* below for details on how to write and submit a patch.
- Blog about Scrapy. Tell the world how you're using Scrapy. This will help newcomers with more examples and will help the Scrapy project to increase its visibility.
- Join the Scrapy subreddit and share your ideas on how to improve Scrapy. We're always open to suggestions.
- Answer Scrapy questions at Stack Overflow.

7.2.1 Reporting bugs

Note

Please report security issues **only** to scrapy-security@googlegroups.com. This is a private list only open to trusted Scrapy developers, and its archives are not public.

Well-written bug reports are very helpful, so keep in mind the following guidelines when you're going to report a new bug.

- check the *FAQ* first to see if your issue is addressed in a well-known question
- if you have a general question about Scrapy usage, please ask it at Stack Overflow (use "scrapy" tag).
- check the open issues to see if the issue has already been reported. If it has, don't dismiss the report, but check the ticket history and comments. If you have additional useful information, please leave a comment, or consider *sending a pull request* with a fix.
- search the scrapy-users list and Scrapy subreddit to see if it has been discussed there, or if you're not sure if what you're seeing is a bug. You can also ask in the `#scrapy` IRC channel.
- write **complete, reproducible, specific bug reports**. The smaller the test case, the better. Remember that other developers won't have your project to reproduce the bug, so please include all relevant files required to reproduce it. See for example StackOverflow's guide on creating a Minimal, Complete, and Verifiable example exhibiting the issue.
- the most awesome way to provide a complete reproducible example is to send a pull request which adds a failing test case to the Scrapy testing suite (see *Submitting patches*). This is helpful even if you don't have an intention to fix the issue yourselves.
- include the output of `scrapy version -v` so developers working on your bug know exactly which version and platform it occurred on, which is often very helpful for reproducing it, or knowing if it was already fixed.

7.2.2 Finding work

If you have decided to make a contribution to Scrapy, but you do not know what to contribute, you have a few options to find pending work:

- Check out the contribution GitHub page, which lists open issues tagged as **good first issue**.

  There are also help wanted issues but mind that some may require familiarity with the Scrapy code base. You can also target any other issue provided it is not tagged as **discuss**.
- If you enjoy writing documentation, there are documentation issues as well, but mind that some may require familiarity with the Scrapy code base as well.
- If you enjoy *writing automated tests*, you can work on increasing our test coverage.
- If you enjoy code cleanup, we welcome fixes for issues detected by our static analysis tools. See `pyproject.toml` for silenced issues that may need addressing.

  Mind that some issues we do not aim to address at all, and usually include a comment on them explaining the reason; not to confuse with comments that state what the issue is about, for non-descriptive issue codes.

If you have found an issue, make sure you read the entire issue thread before you ask questions. That includes related issues and pull requests that show up in the issue thread when the issue is mentioned elsewhere.

We do not assign issues, and you do not need to announce that you are going to start working on an issue either. If you want to work on an issue, just go ahead and *write a patch for it*.

Do not discard an issue simply because there is an open pull request for it. Check if open pull requests are active first. And even if some are active, if you think you can build a better implementation, feel free to create a pull request with your approach.

If you decide to work on something without an open issue, please:

- Do not create an issue to work on code coverage or code cleanup, create a pull request directly.
- Do not create both an issue and a pull request right away. Either open an issue first to get feedback on whether or not the issue is worth addressing, and create a pull request later only if the feedback from the team is positive, or create only a pull request, if you think a discussion will be easier over your code.

- Do not add docstrings for the sake of adding docstrings, or only to address silenced Ruff issues. We expect docstrings to exist only when they add something significant to readers, such as explaining something that is not easier to understand from reading the corresponding code, summarizing a long, hard-to-read implementation, providing context about calling code, or indicating purposely uncaught exceptions from called code.
- Do not add tests that use as much mocking as possible just to touch a given line of code and hence improve line coverage. While we do aim to maximize test coverage, tests should be written for real scenarios, with minimum mocking. We usually prefer end-to-end tests.

7.2.3 Writing patches

The better a patch is written, the higher the chances that it'll get accepted and the sooner it will be merged.

Well-written patches should:

- contain the minimum amount of code required for the specific change. Small patches are easier to review and merge. So, if you're doing more than one change (or bug fix), please consider submitting one patch per change. Do not collapse multiple changes into a single patch. For big changes consider using a patch queue.
- pass all unit-tests. See *Running tests* below.
- include one (or more) test cases that check the bug fixed or the new functionality added. See *Writing tests* below.
- if you're adding or changing a public (documented) API, please include the documentation changes in the same patch. See *Documentation policies* below.
- if you're adding a private API, please add a regular expression to the `coverage_ignore_pyobjects` variable of `docs/conf.py` to exclude the new private API from documentation coverage checks.

  To see if your private API is skipped properly, generate a documentation coverage report as follows:

  ```
  tox -e docs-coverage
  ```

- if you are removing deprecated code, first make sure that at least 1 year (12 months) has passed since the release that introduced the deprecation. See *Deprecation policy*.

7.2.4 Submitting patches

The best way to submit a patch is to issue a pull request on GitHub, optionally creating a new issue first.

Remember to explain what was fixed or the new functionality (what it is, why it's needed, etc). The more info you include, the easier will be for core developers to understand and accept your patch.

If your pull request aims to resolve an open issue, link it accordingly, e.g.:

```
Resolves #123
```

You can also discuss the new functionality (or bug fix) before creating the patch, but it's always good to have a patch ready to illustrate your arguments and show that you have put some additional thought into the subject. A good starting point is to send a pull request on GitHub. It can be simple enough to illustrate your idea, and leave documentation/tests for later, after the idea has been validated and proven useful. Alternatively, you can start a conversation in the Scrapy subreddit to discuss your idea first.

Sometimes there is an existing pull request for the problem you'd like to solve, which is stalled for some reason. Often the pull request is in a right direction, but changes are requested by Scrapy maintainers, and the original pull request author hasn't had time to address them. In this case consider picking up this pull request: open a new pull request with all commits from the original pull request, as well as additional changes to address the raised issues. Doing so helps a lot; it is not considered rude as long as the original author is acknowledged by keeping his/her commits.

You can pull an existing pull request to a local branch by running `git fetch upstream pull/$PR_NUMBER/head:$BRANCH_NAME_TO_CREATE` (replace 'upstream' with a remote name for scrapy repository, `$PR_NUMBER` with

an ID of the pull request, and `$BRANCH_NAME_TO_CREATE` with a name of the branch you want to create locally). See also: https://docs.github.com/en/pull-requests/collaborating-with-pull-requests/reviewing-changes-in-pull-requests/checking-out-pull-requests-locally#modifying-an-inactive-pull-request-locally.

When writing GitHub pull requests, try to keep titles short but descriptive. E.g. For bug #411: "Scrapy hangs if an exception raises in start_requests" prefer "Fix hanging when exception occurs in start_requests (#411)" instead of "Fix for #411". Complete titles make it easy to skim through the issue tracker.

Finally, try to keep aesthetic changes (**PEP 8** compliance, unused imports removal, etc) in separate commits from functional changes. This will make pull requests easier to review and more likely to get merged.

7.2.5 Coding style

Please follow these coding conventions when writing code for inclusion in Scrapy:

- We use black for code formatting. There is a hook in the pre-commit config that will automatically format your code before every commit. You can also run black manually with `tox -e pre-commit`.
- Don't put your name in the code you contribute; git provides enough metadata to identify author of the code. See https://docs.github.com/en/get-started/getting-started-with-git/setting-your-username-in-git for setup instructions.

7.2.6 Pre-commit

We use pre-commit to automatically address simple code issues before every commit.

After your create a local clone of your fork of the Scrapy repository:

1. Install pre-commit.
2. On the root of your local clone of the Scrapy repository, run the following command:

```
pre-commit install
```

Now pre-commit will check your changes every time you create a Git commit. Upon finding issues, pre-commit aborts your commit, and either fixes those issues automatically, or only reports them to you. If it fixes those issues automatically, creating your commit again should succeed. Otherwise, you may need to address the corresponding issues manually first.

7.2.7 Documentation policies

For reference documentation of API members (classes, methods, etc.) use docstrings and make sure that the Sphinx documentation uses the `autodoc` extension to pull the docstrings. API reference documentation should follow docstring conventions (PEP 257) and be IDE-friendly: short, to the point, and it may provide short examples.

Other types of documentation, such as tutorials or topics, should be covered in files within the `docs/` directory. This includes documentation that is specific to an API member, but goes beyond API reference documentation.

In any case, if something is covered in a docstring, use the `autodoc` extension to pull the docstring into the documentation instead of duplicating the docstring in files within the `docs/` directory.

Documentation updates that cover new or modified features must use Sphinx's `versionadded` and `versionchanged` directives. Use `VERSION` as version, we will replace it with the actual version right before the corresponding release. When we release a new major or minor version of Scrapy, we remove these directives if they are older than 3 years.

Documentation about deprecated features must be removed as those features are deprecated, so that new readers do not run into it. New deprecations and deprecation removals are documented in the *release notes*.

7.2.8 Tests

Tests are implemented using the Twisted unit-testing framework. Running tests requires tox.

Running tests

To run all tests:

```
tox
```

To run a specific test (say `tests/test_loader.py`) use:

```
tox -- tests/test_loader.py
```

To run the tests on a specific tox environment, use `-e <name>` with an environment name from `tox.ini`. For example, to run the tests with Python 3.10 use:

```
tox -e py310
```

You can also specify a comma-separated list of environments, and use tox's parallel mode to run the tests on multiple environments in parallel:

```
tox -e py39,py310 -p auto
```

To pass command-line options to pytest, add them after `--` in your call to tox. Using `--` overrides the default positional arguments defined in `tox.ini`, so you must include those default positional arguments (`scrapy tests`) after `--` as well:

```
tox -- scrapy tests -x  # stop after first failure
```

You can also use the pytest-xdist plugin. For example, to run all tests on the Python 3.10 tox environment using all your CPU cores:

```
tox -e py310 -- scrapy tests -n auto
```

To see coverage report install coverage (`pip install coverage`) and run:

```
coverage report
```

see output of `coverage --help` for more options like html or xml report.

Writing tests

All functionality (including new features and bug fixes) must include a test case to check that it works as expected, so please include tests for your patches if you want them to get accepted sooner.

Scrapy uses unit-tests, which are located in the tests/ directory. Their module name typically resembles the full path of the module they're testing. For example, the item loaders code is in:

```
scrapy.loader
```

And their unit-tests are in:

```
tests/test_loader.py
```

7.3 Versioning and API stability

7.3.1 Versioning

There are 3 numbers in a Scrapy version: *A.B.C*

- *A* is the major version. This will rarely change and will signify very large changes.
- *B* is the release number. This will include many changes including features and things that possibly break backward compatibility, although we strive to keep these cases at a minimum.
- *C* is the bugfix release number.

Backward-incompatibilities are explicitly mentioned in the *release notes*, and may require special attention before upgrading.

Development releases do not follow 3-numbers version and are generally released as `dev` suffixed versions, e.g. `1.3dev`.

> **Note**
>
> With Scrapy 0.* series, Scrapy used odd-numbered versions for development releases. This is not the case anymore from Scrapy 1.0 onwards.
>
> Starting with Scrapy 1.0, all releases should be considered production-ready.

For example:

- *1.1.1* is the first bugfix release of the *1.1* series (safe to use in production)

7.3.2 API stability

API stability was one of the major goals for the *1.0* release.

Methods or functions that start with a single dash (_) are private and should never be relied as stable.

Also, keep in mind that stable doesn't mean complete: stable APIs could grow new methods or functionality but the existing methods should keep working the same way.

7.3.3 Deprecation policy

We aim to maintain support for deprecated Scrapy features for at least 1 year.

For example, if a feature is deprecated in a Scrapy version released on June 15th 2020, that feature should continue to work in versions released on June 14th 2021 or before that.

Any new Scrapy release after a year *may* remove support for that deprecated feature.

All deprecated features removed in a Scrapy release are explicitly mentioned in the *release notes*.
